

# PV Impact on the Electric Grid

*March 19, 2012  
PJM NEMSTF*

# Overview

- Three Critical Areas for Higher Penetration Solutions
- Typical Feeder with Automatic Line Equipment
- PV Issues with Different Size Systems and Potential Solutions
  - Large PV (Greater than 3 MWs)
  - Medium PV (250 kW – 3 MW)
  - Small PV (less than 250 kW)
- Utility Efforts to Accommodate PV

# Pepco Holdings, Inc.

3 states and Washington DC in mid-Atlantic US

A PHI Company

648 sq mi (575 in MD)

782,000 cust (528,000 in MD)

4 and 13kV distribution

A PHI Company

5,400 sq mi (3,500 in MD)

498,000 cust (199,000 in MD)

4, 12, 25 and 34kV distribution

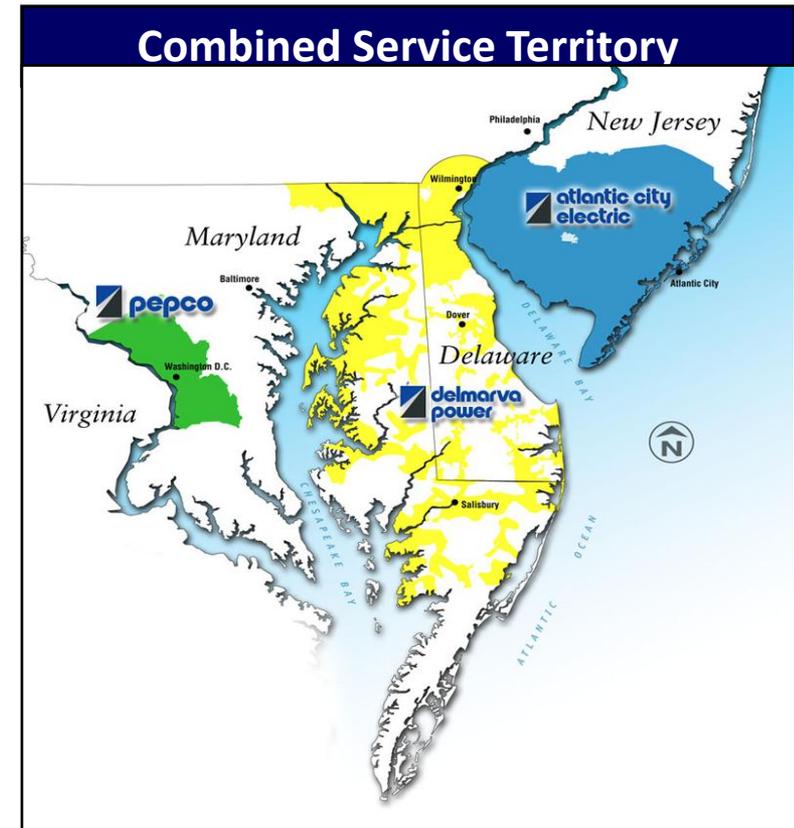

A PHI Company

2,700 sq mi

546,000 cust

4, 12, 23, and 34kV distribution

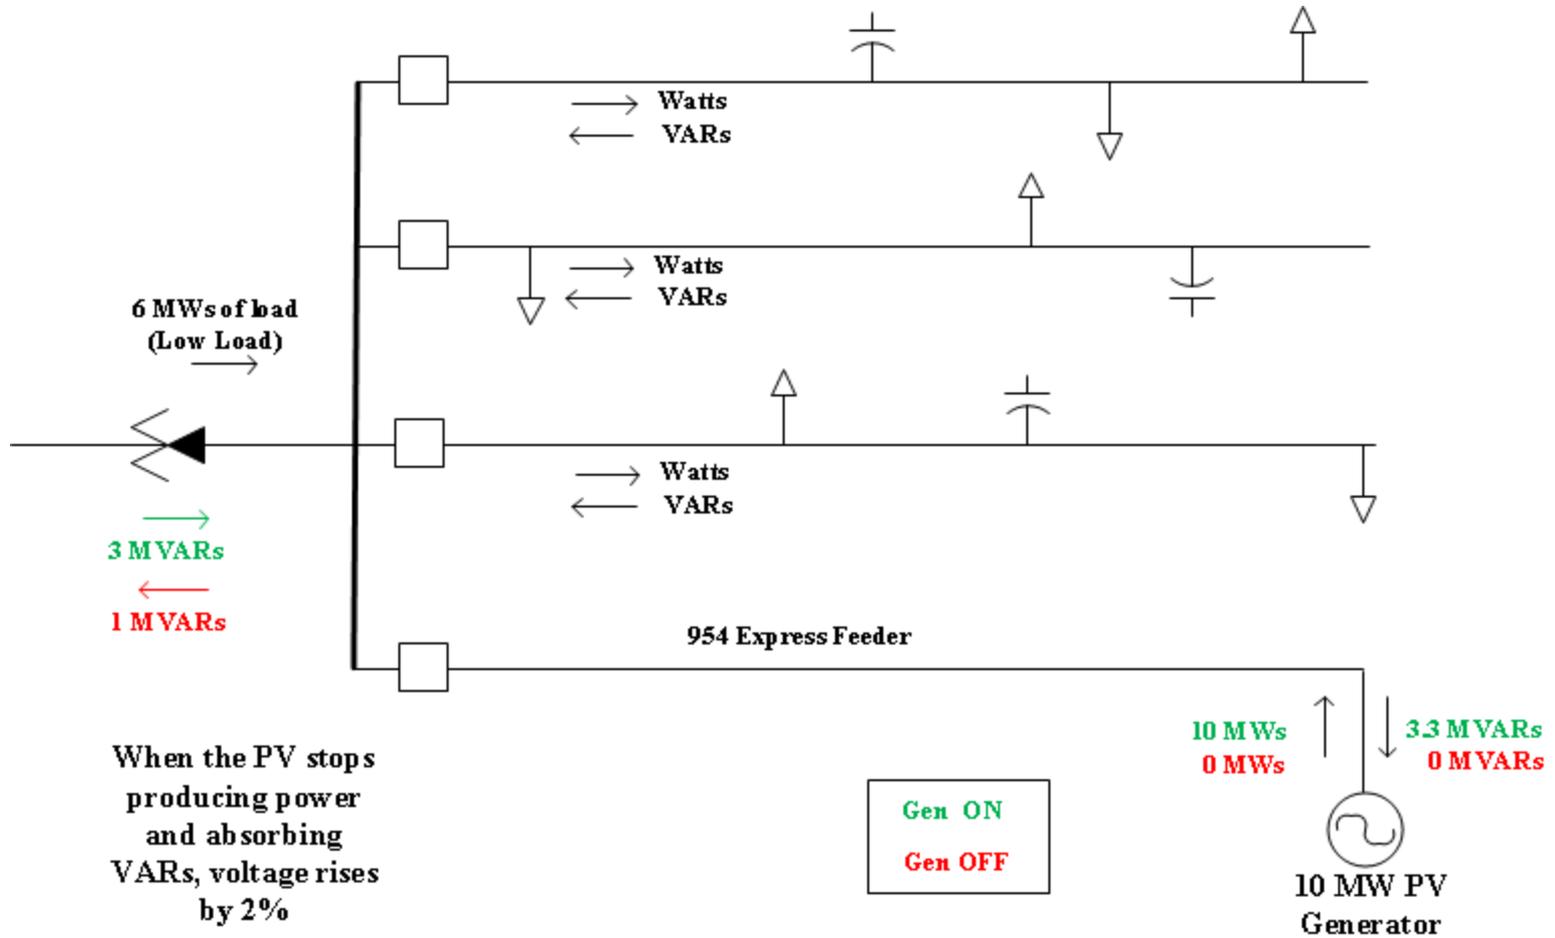

# Large Solar – 3 MW to 20 MW

# Potential Voltage Rise and Fluctuations

- Simulated Voltage Levels for 18 MW PV System (on 120V base)
  - System Off 124.0
  - 0.97 Leading PF 125.9 ← setting
  - Unity PF 126.8
  - 0.97 Lagging PF 127.4
- Tariff Limit: 115.2 – 124.8 V (+/- 4%)
- Feeder Voltage: 12,470 V phase to phase
- Injection to Substation: 9MWs each on 2 fdrs.
- Substation has 2 other load carrying fdrs.

# Low Load Single Line

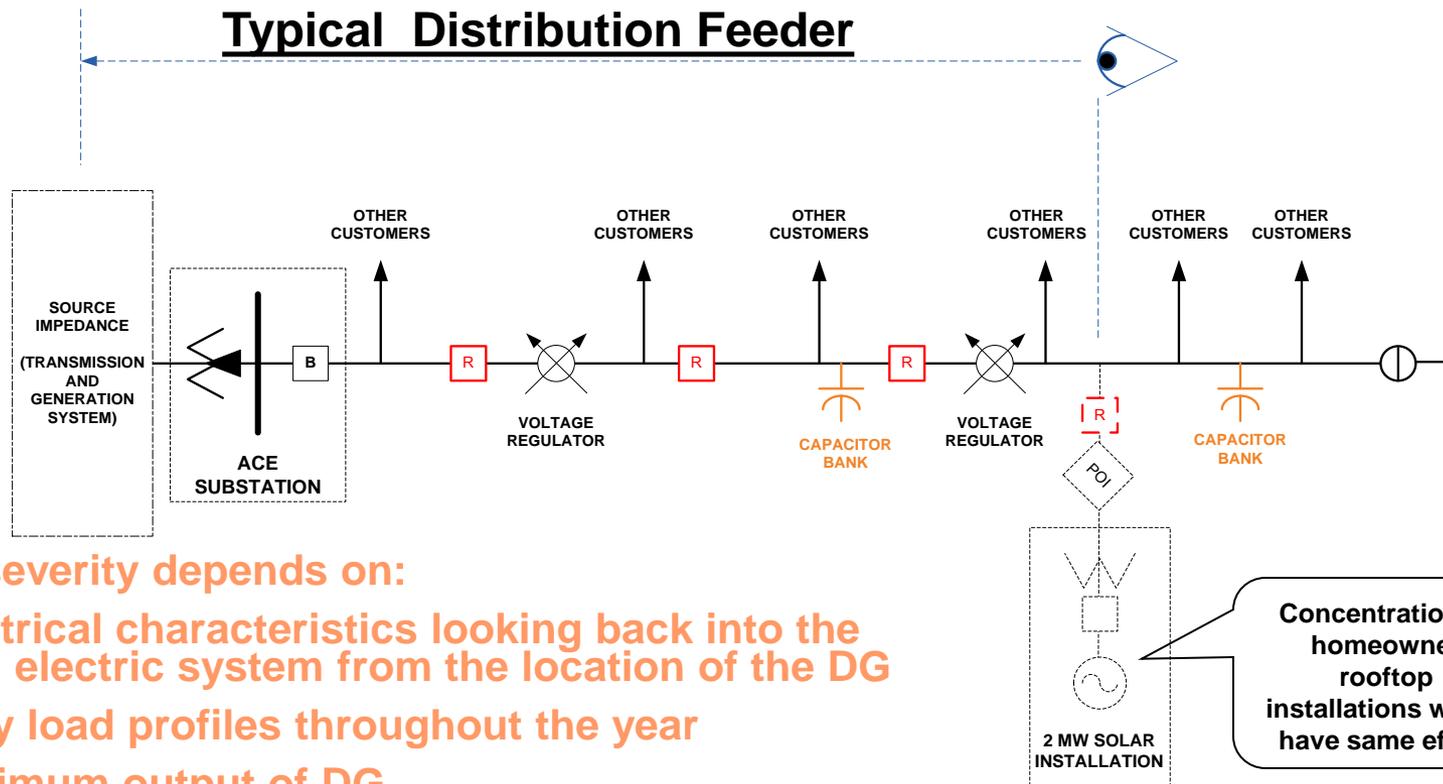

# ***Issues and Solutions for Large Solar***

- Voltage Rise or Fluctuation on express feeder
  - Move interconnection to higher voltage level, PF, future use of dynamic var control, limit ramp rate, curtailment, SCADA
- Voltage regulation for other feeders – smart LTC controls
- Losses – Move to higher voltage level and/or connect load to circuits
- System Stability – Low Voltage Ride Through

# Medium Solar – 250 kW - 3 MW

# Impacts to a Distribution Feeder

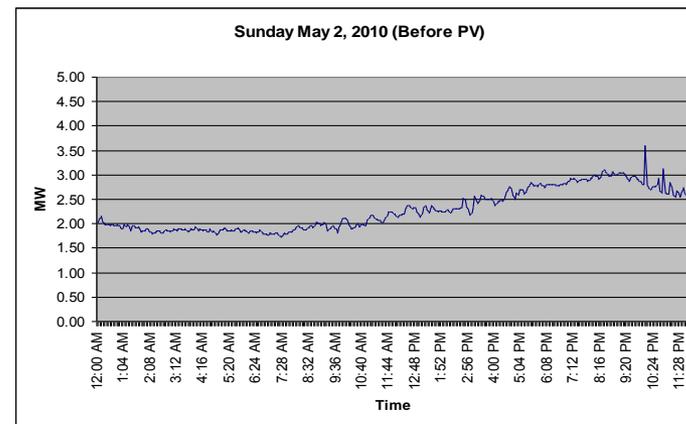

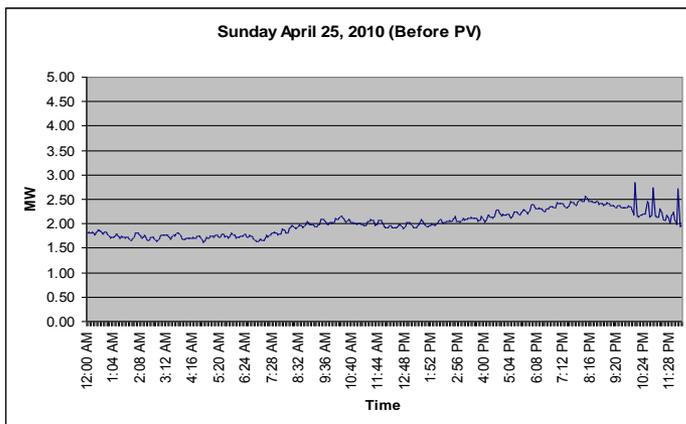

- Impact severity depends on:

- Electrical characteristics looking back into the ACE electric system from the location of the DG
- Daily load profiles throughout the year
- Maximum output of DG
- Substation transformer settings
- Location and settings of regulators, capacitors, and reclosers

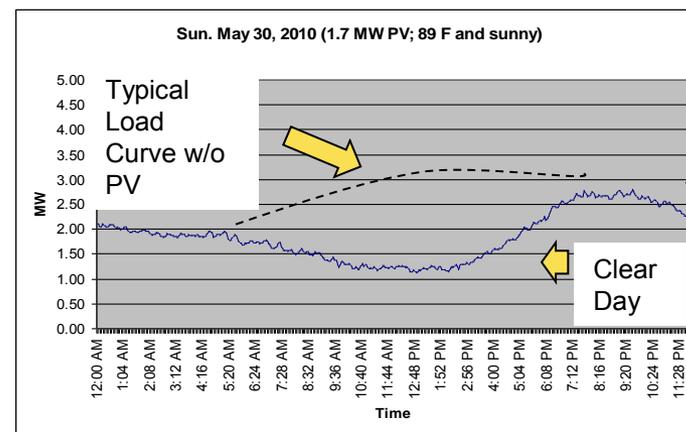

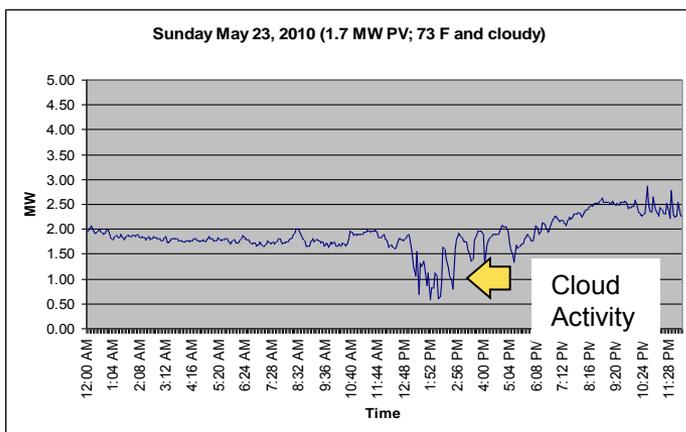

adapted from actual DG customer application

# Distribution System Impacts (cont.)

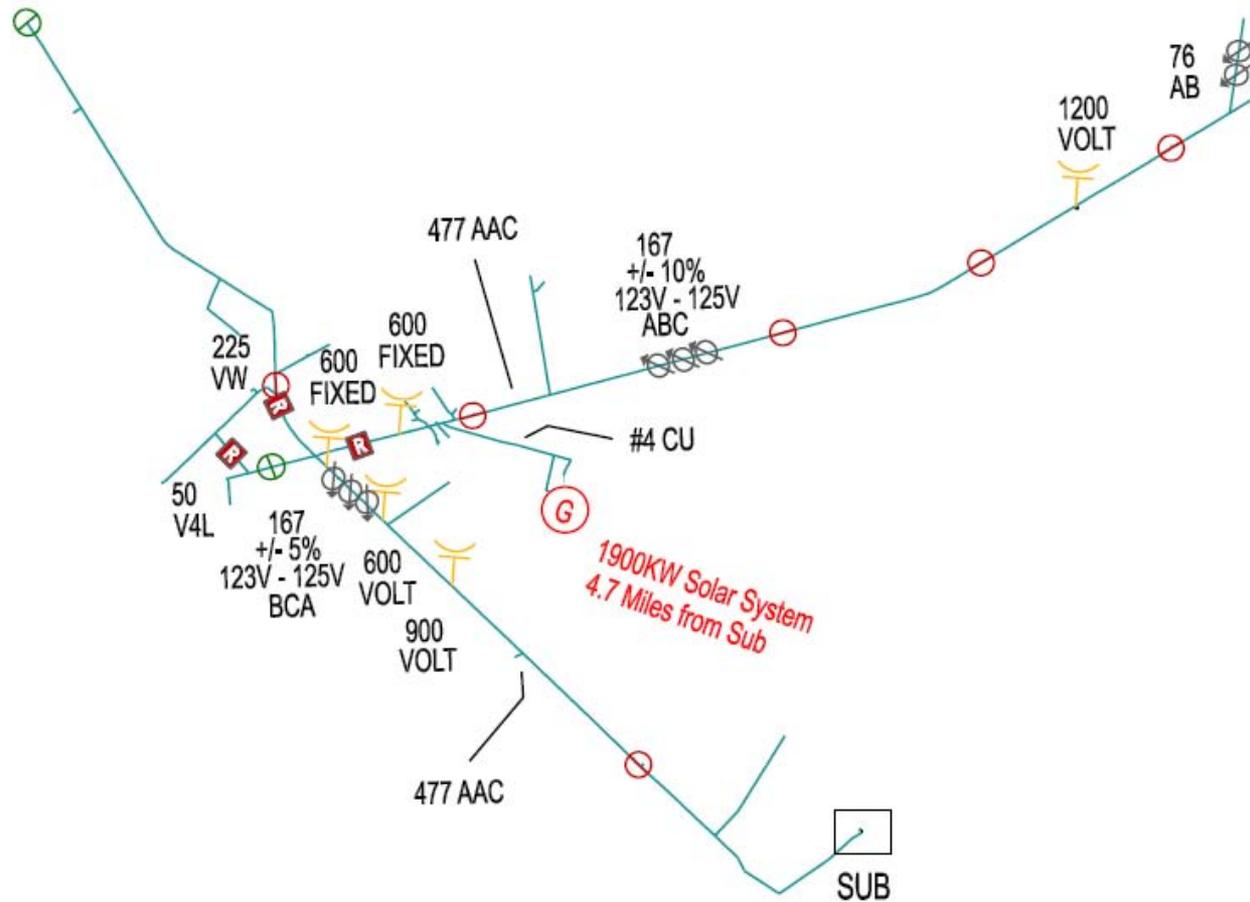

Sunday Load Profile Before and After 1.7 MW PV Installation as seen at Feeder Terminal

Industrial  
Load  
Startup

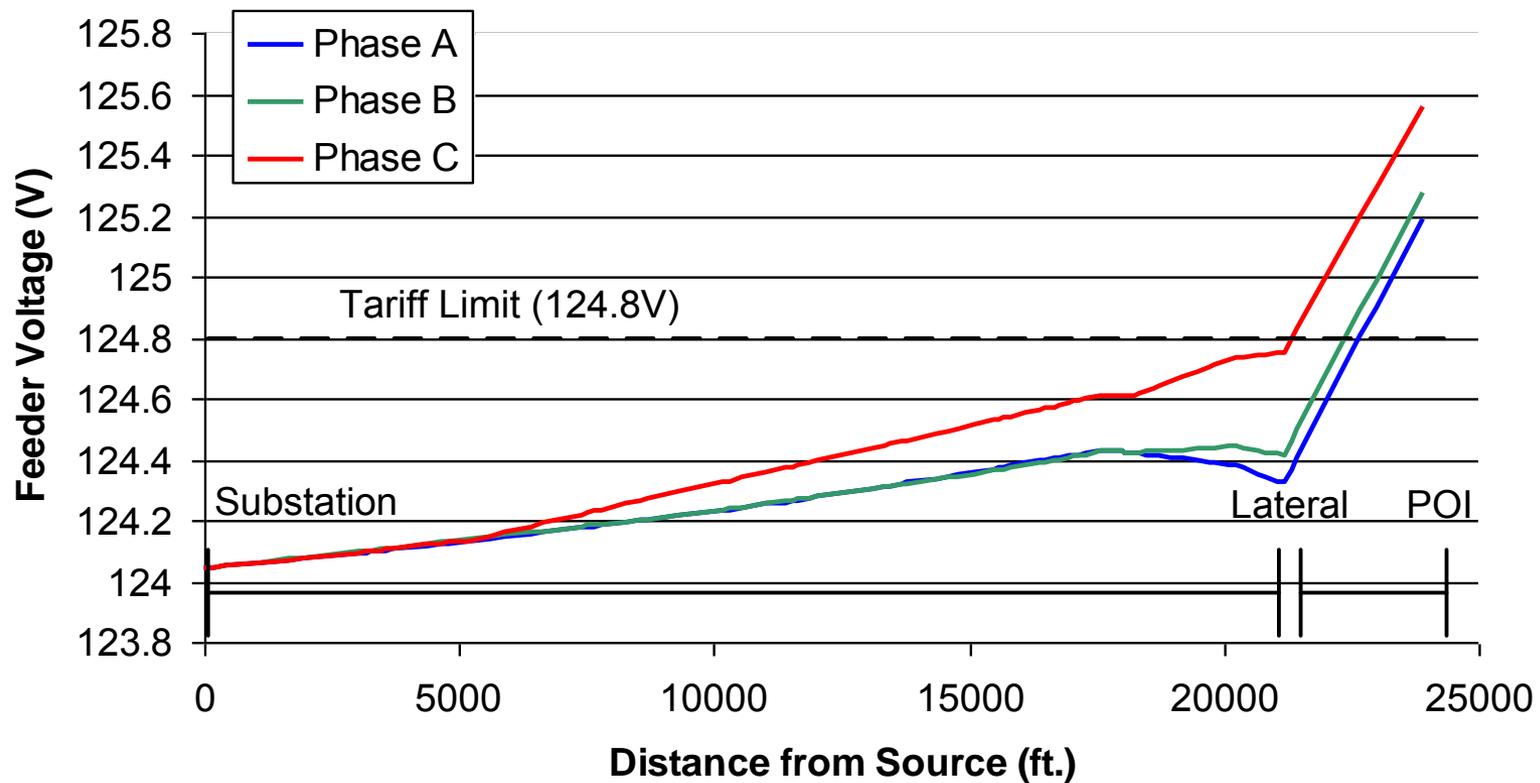

# 1.9 MW PV System (Feeder Nominal Voltage: 12,470V)

# 1.9 MW PV System

## Voltage from Substation to PV POI 1.00 PF

# 1.9 MW PV System – 3 Options to Mitigate Voltage Issues

Summary Table				
	*Maximum Steady State Voltage(V)	Maximum Voltage Fluctuation at the PV site(V)	Maximum Voltage Fluctuation at the Upstream Regulator(V)	Cost
Without Mitigation	125.3	2.3	1.0	\$0
Absorbing Power Factor Solution**	124.0	1.2	0.2	\$2,200
500KVA/1500kWh Battery Solution	125.0	0.5	0.1	\$1,115,014
750KVA/3000kWh Battery Solution	124.7	0.0	0.0	\$2,189,390
477 AAC Reconductor	124.9	1.3	1.1	\$266,000

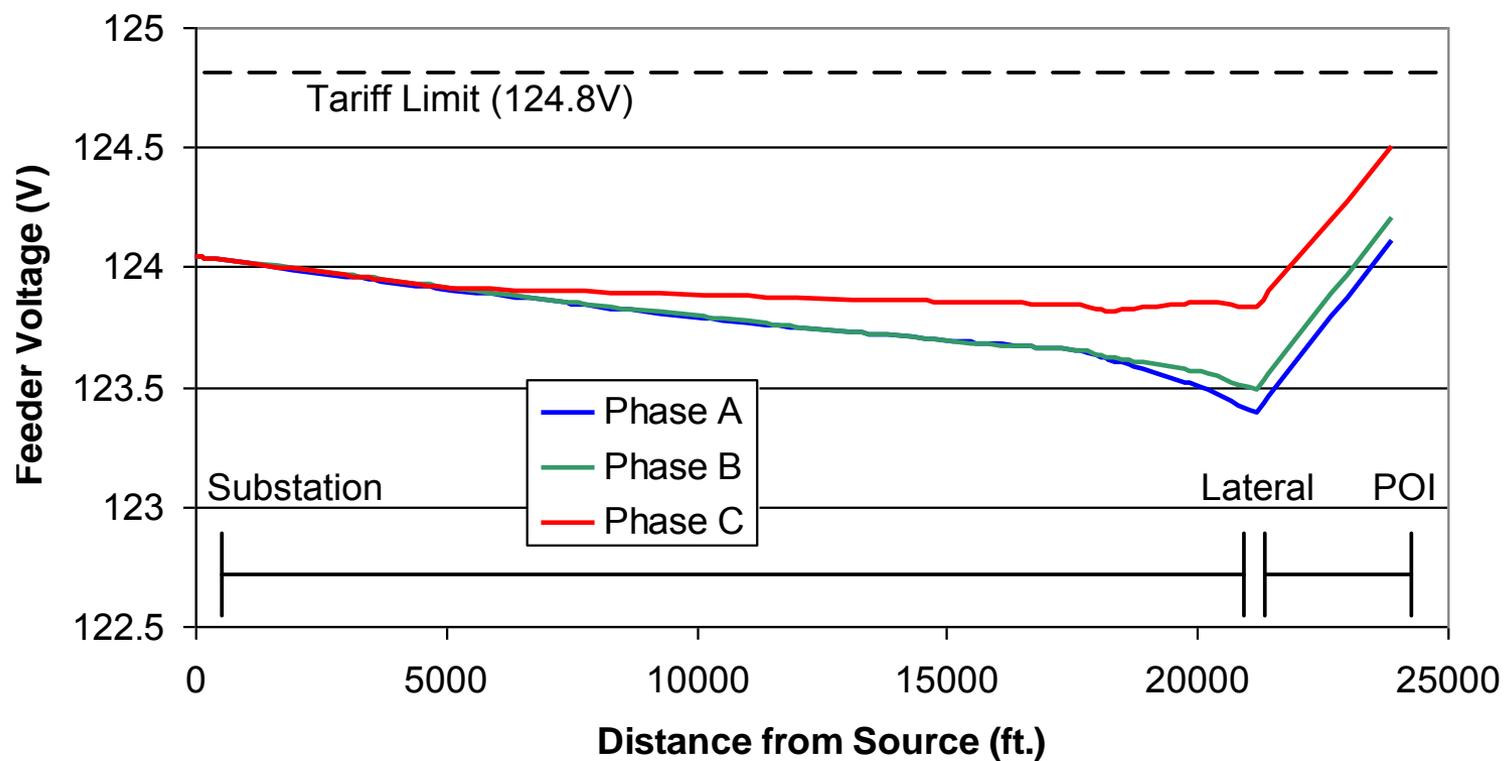

\*All Maximum Steady State Voltages occurred during low load,

\*\*Absorbing Power Factor of .97 was used for this study

\*\*\*The battery storage solution is unlike the other solutions and may have other operating value streams but also may have maintenance and/or replacement costs over the life of the solar system. These have not been investigated and included in this comparison.

# 1.9 MW PV System

Voltage from Substation to PV POI  
0.97 Leading PF

# ***Issues and Solutions for Medium Solar***

- Voltage Rise and Fluctuation, especially at greater distances from the sub – which can effect automatic line equipment and if high enough cause voltage violations for customers
  - Utilize an absorbing (leading) PF on the inverters (fixed or on a schedule)
  - Move Capacitor or Voltage Regulator further away from POI, adjust settings if necessary

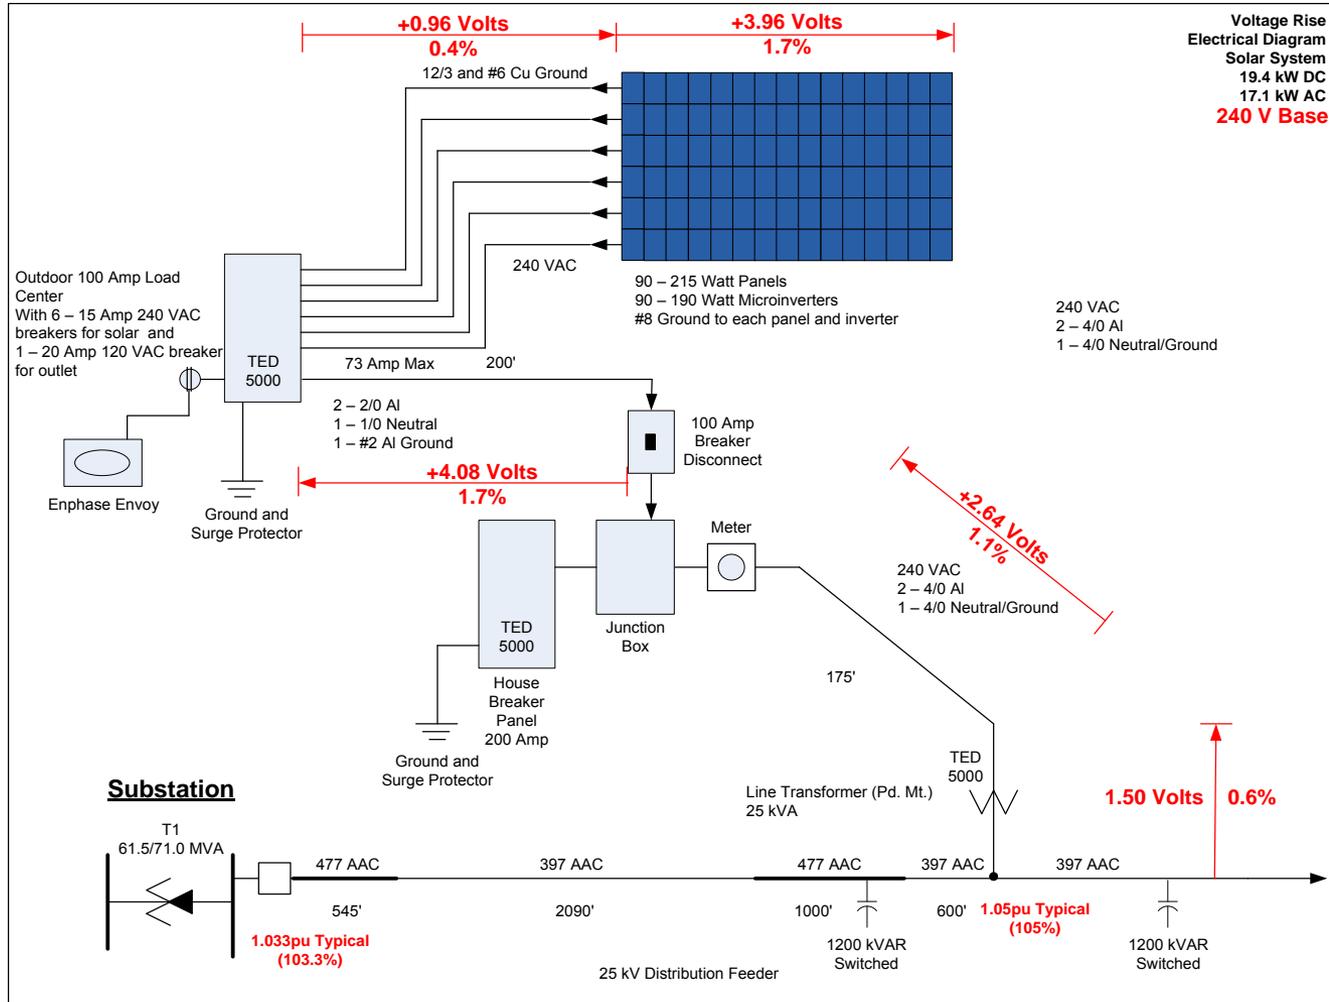

# ***Issues and Solutions for Medium Solar (cont.)***

- Utilize battery storage
- Upgrade the conductor size
- Implement Advanced Feeder Management to reduce line voltage during peak solar output
- Utilize flexible load control to increase load at high solar output periods
- Utilize an SVC
- Reduce the size of the PV system

# Small Solar – 250 kW or less

# Voltage Rise

# Voltage Rise Chart

(at max gen and no load)

Nominal Voltages: 120V or 240V

Max Voltage at Meter: 126V or 252V (per ANSI)

Electrical Segment	Voltage Rise		
	@ 120V	@ 240V	%
Microinverter String to End	2.0	4.0	1.7
Connection to PV Breaker Panel	0.5	1.0	0.4
Line to PV Disconnect (2/0 Al)	2.0	4.0	1.7
<b>Sub-total</b>	<b>4.5</b>	<b>9.0</b>	<b>3.8</b>
Service Drop	1.3	2.6	1.1
Line Transformer	0.8	1.6	0.6
<b>Total</b>	<b>6.6</b>	<b>13.2</b>	<b>5.5</b>

Note: The microinverter voltage measurement accuracy is +/- 2.5%

# ***Issues and Solutions for Small Solar***

- Voltage Rise - especially with small line transformer, long or small service, and with distance to the inverters – this can cause inadvertent tripping of inverters and/or high voltage at the premise
  - Contractor or home owner should do careful voltage rise calculation – include potential voltage rise across service and transformer

# ***Issues and Solutions for Small Solar (cont.)***

- Contractor or owner review design, using larger conductor, shorter distances, etc.
- Utilize an absorbing (leading) PF on the inverters (not common for single phase inverters)
- Use Home Energy Manager to move flexible loads to high output periods
- Utility adjust settings on closest Capacitor or Voltage Regulator to reduce voltage a little at the customer meter if necessary

# ***Issues and Solutions for Small Solar (cont.)***

- Customer can utilize battery system to reduce peak output, take advantage of TOU rates (where available) and have premium power
- Use flexible load control via AMI if available
- Inverter learns and adjusts PF during certain times of day
- Utility provides setting changes via AMI (PF or VARS and active power output)

# ***Utility Efforts to Accommodate PV***

- New electric system model of both the T & D system that will run time series analysis with all renewables and other generation represented as well as load – will provide aggregate impact, large system impact studies and higher penetration studies
- Collaborative R & D on new anti-islanding scheme

# ***Utility Efforts to Accommodate PV (cont.)***

- Collaborative R & D on dynamic var control, centrally controlled vars
- Collaborative effort on collecting 1 second data from multiple points on a feeder and large PV system output to better understand impact on automatic line equipment and model penetration limit

# ***Utility Efforts to Accommodate PV (cont.)***

- Collaborative effort to verify the accuracy of atmospheric data, both historical and predicted
- Effort to utilize AMI to monitor and possibly provide control signals to small size inverters
- Reviewing Cellular SCADA for large size systems

## ***Efforts Underway (Cont.)***

- Integrating PV output data into Distributed Automation schemes
- Reviewing feasibility of a completely online and automated way for applying and approving PV systems, reprogramming the meter, then transmitting output data automatically -- for very small/low impact systems in areas with AMI.
- Advanced Volt/VAR Control

# Smart Energy

## SMART GRID

- ISO (Independent Sys.Operator)
  - Bulk Generation
  - Bulk Transmission
    - Synchrophasors
- LDC (Local Distribution Co.)
  - Transmission
  - Substation
    - Power Transformers
  - Feeders
    - Distributed Automation
    - Conductors, ALE
    - Line Transformers
    - Advanced Fdr Mgmt
- AMI
  - Outage Mgmt
  - Load Profile Info
  - HAN (Home Area Network)
    - Price and other comm.

## SMART INVERTER

- Low Voltage Ride Thru
- Ramp Rate Control
- Autonomous & Centralized Control
  - VAR/PF Control
    - Fixed/Dynamic
    - Algorithm based
  - Curtailment
  - Remote Trip
- WITH BATTERY
  - Premium Power
  - Voltage Control
  - Frequency Regulation
  - Spinning Reserve
  - Arbitrage (TOU or Real Time Pricing)
  - Demand Side Mgmt
  - Pk Demand Mgmt.

## SMART PREMISE

- HEMS (Home Energy Mgmt System)
  - Pricing Signal Response
  - Peak Load Control
- DER (Distributed Energy Resource)
- Smart Thermostat
- Smart Appliances
- Smart HVAC
  - Thermal Storage
- EV
  - Controllable Charging
- Remote Access and Control
- Energy Efficiency Controls
  - Turn off Phantom Loads
  - Vacant space mgmt.
- Direct Use of DC
