

Intraday Offers Education

September 15, 2017

- PJM has made all efforts possible to accurately document all information in this presentation. The information seen here does not supersede the PJM Operating Agreement or the PJM Tariff or any pending FERC Filings or Orders.

<http://www.pjm.com/documents/agreements/pjmagreements.aspx>

Introduction**12:00 p.m. – 12:15 p.m.****General Impacts, Opt Out**Impacts to Day-Ahead Market, Rebid
Period, Intraday Period

12:15 p.m. – 12:50 p.m.

Demand Response, Ancillary Services
Switch to Cost, TPS, and Dual Fuel
Availability

12:50 p.m. – 2:00 p.m.

Break

2:00 p.m. – 2:15 p.m.

Settlements

2:15 p.m. – 3:30 p.m.

Close/Final questions**3:30 p.m. – 3:45 p.m.**

Introduction

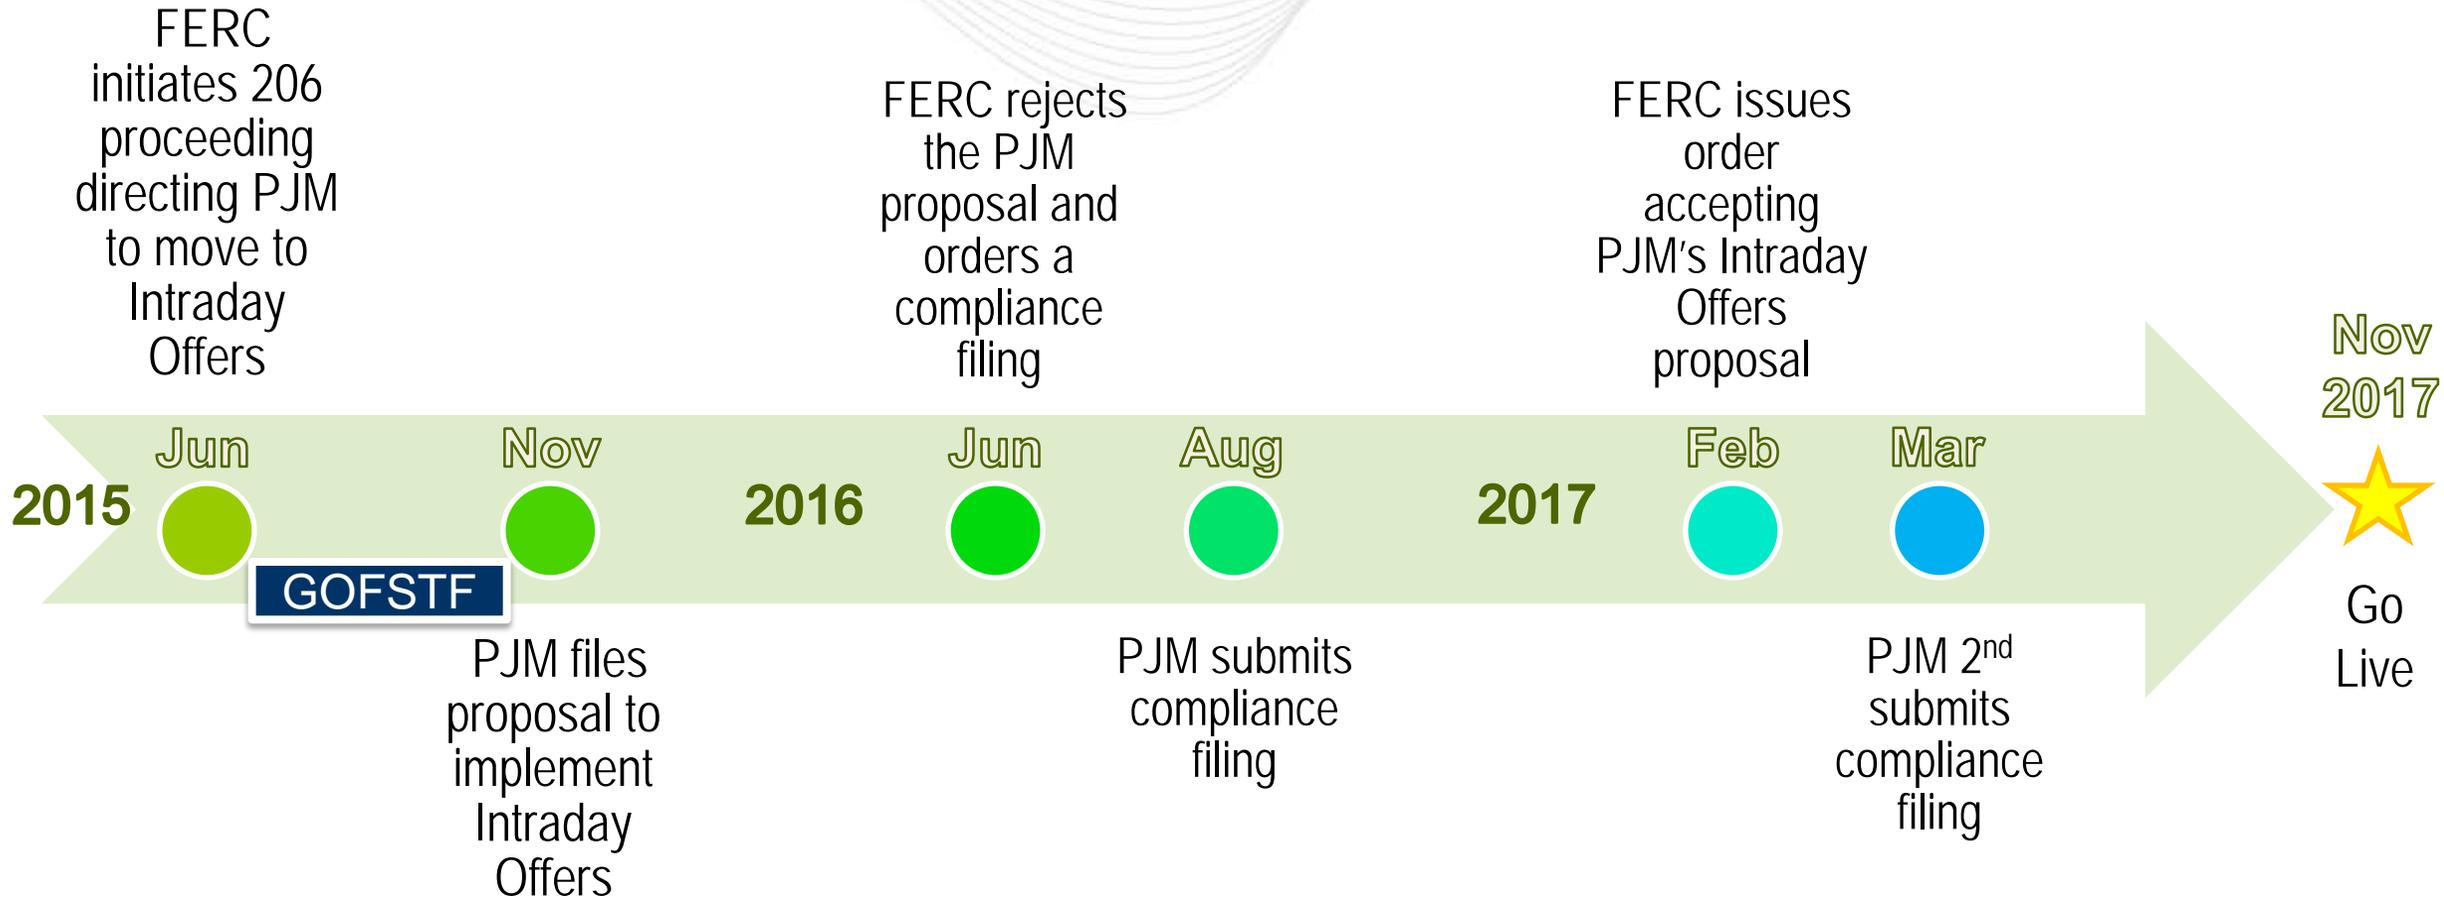

- Introduction of Intraday Offers (IDO) will enable hourly differentiation and modifications for certain parameters of supply offers for
 - Generation Resources
 - Demand Resources
- Benefits:
 - Allows Energy Market offers to be more flexible
 - Allows participants to more accurately reflect costs throughout the operating day
 - Improved coordination with the gas market timing

	Today	IDO
Offer Curve Granularity	Daily Curve	Hourly Differentiated Curves
Update Timeline	No updates after Rebid Period	Updates permitted 65 minutes prior to operating hour*
Regulation and Sync Reserve Offer Flexibility	Daily Offer	Hourly Offer
Dual Fuel Flexibility	Election made day before; updates made 3 hours in advance of operating hour	65 minutes in advance of operating hour
Market Mitigation	Offline units evaluated	Online and Offline units evaluated, Self-Scheduled units included

*Subject to business rules specified in later slides

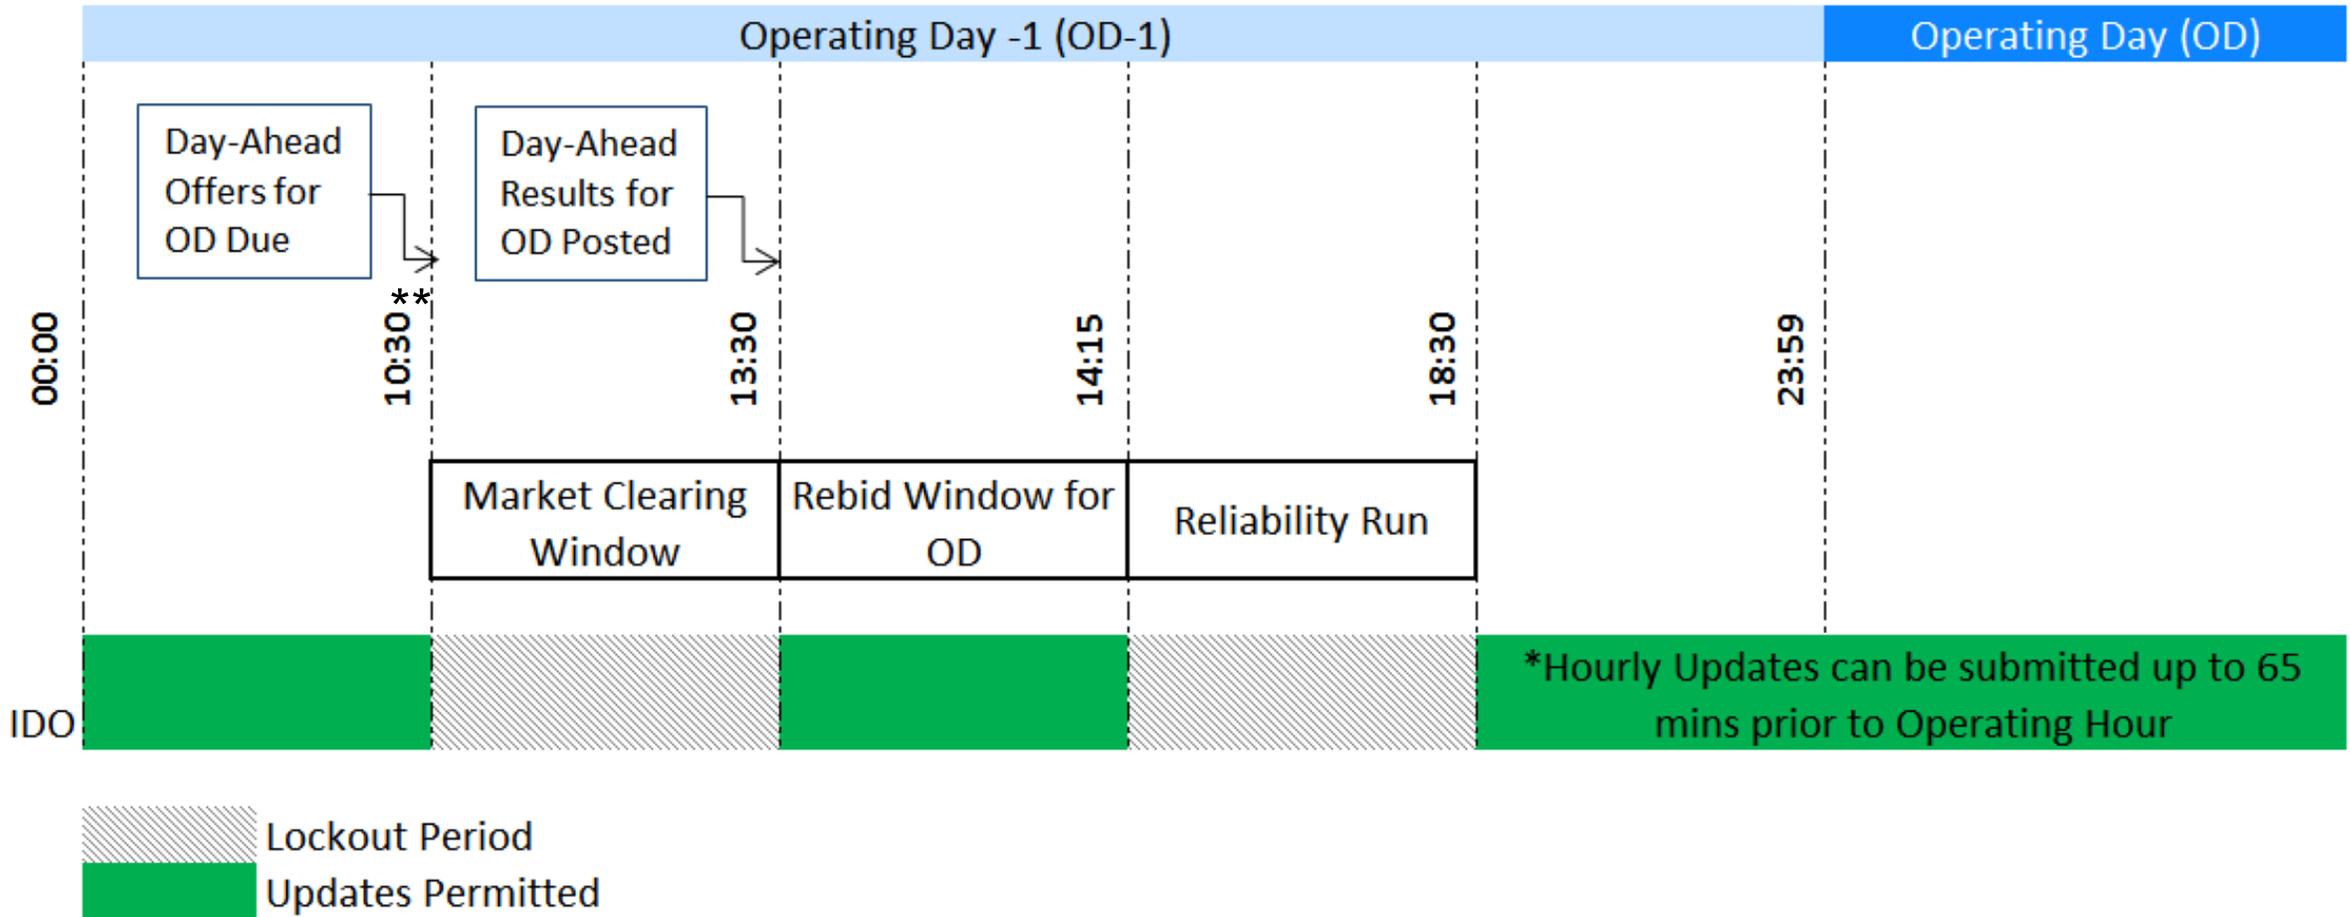

Intraday Offers (Hourly Offers) Filing History

Market trials scheduled for September 19 & 20 and October 4 & 5

- Market trial days will be available on Sep. 19 & 20 and Oct. 4 & 5. Markets personnel will be dedicated to answering questions and helping to resolve any issues.
- Users will have the ability to:
 - Enter DA daily and differentiated offer information
 - See DA results daily on the Markets Results screen
 - Exercise price updates for committed/uncommitted schedules
 - Enter hourly updates while observing lock-out periods
- Notes:
 - All of the above are available on a daily basis, everyday
 - Intraday Offers Train environment does not have RT engines or RT dispatching
 - Although there are no RT commitments, DA commitments can be used to experience price updates for committed/uncommitted schedules and lockout periods
 - There is no Settlements capability

** PJM has extended this hour to 11:00 with Manual 11 Section 2.3.1

General Impacts

- The implementation of Intraday Offers will limit the schedule IDs that can be created and offered
 - This impacts all Generation resources, not just those that plan to update schedules hourly
- Schedules using IDs not in the new list cannot be made available in Markets Gateway starting on the November 1 market day
- Members should begin using the reduced number of Intraday Offers schedule IDs at their earliest convenience to minimize the implementation impact

Schedule IDs Currently Allowed

Cost Based Schedules:
1-69, 80-89

Price Based PLS Schedules:
70-79

Price Based Schedules:
91 -99

Schedule IDs Allowed in Intraday Offers

Cost Based Schedules:
1-12*

Price Based PLS Schedule:
79

Price Based Schedule:
99

- PJM posted a step by step guide with instructions to:
 - Create new schedules with the accepted IDs
 - Download existing schedule details to copy to the new accepted IDs
 - [Guide to Convert Schedule IDs in Markets Gateway](#) has been added to the Markets Gateway Tools page, under Intraday Offers
- Will require Market Seller action by October 31 in order to offer into the Day-Ahead Market on November 1

*Number of cost based schedules increased to 12

- Today Generation schedules can be assigned a Market Type
 - Day-Ahead
 - Balancing
 - Both
- With the Intraday Offers Implementation, this Market Type field will be removed from the Schedule Detail and Schedule Selection screens
- Non-Capacity Resources wishing to offer only in Real Time may change the unit's Commit Status from Unavailable prior to DA to Available after the DA Market

- Units wishing to offer differently between DA and RT can update schedule availability during the Rebid Period
 - Exceptions exist for Dual Fuel units
- May update the offer intraday

- Opt-out is the default for all units at go-live, and for any new units added at a later date, but the option to opt-in is available
- For units electing to opt-in:
 - The opt-in election must be specified in the Fuel Cost policy
 - A methodology for developing costs intraday must be specified in the Fuel Cost Policy
 - Units can change their election and opt-out on a monthly basis, as long as the option to do so is specified in their Fuel Cost Policy

- Users must communicate their desire to opt in or opt out prior to midnight of the 15th day of the month prior to the month the election will begin
 - An exception to this rule will be made for new Fuel Cost Policies approved outside of the above timeline. In this case, PJM will manually set the opt-in/out
 - For Nov. 1, PJM will manually opt-in units that have specified it in their Fuel Cost Policy, and that policy is approved prior to Nov. 1
- Opt in/out is generator specific, and continues until the user cancels
- There is no XML capability for opt out
- There is no opt-out option for Demand Response

- If a Generator chooses to opt out of Hourly updates in accordance with their Fuel Cost Policy, certain capability is still available:

If a Generator opts out, they may:

- Provide hourly differentiation for their DA offer
- Update the incremental energy offer, min run time, and no load and startup costs during the Rebid period for hours where the unit does not have a Day-Ahead commitment.
- Update schedule based notification time (except during lockout periods)
- Utilize “Switch to Cost” functionality
- Update Regulation and Spin MW values 65 minutes prior to the operating hour

If a Generator opts out, they may NOT:

- Update incremental energy offer, min run time, no load and start-up costs after the Rebid period
- Update Regulation and Spin cost and price after the rebid period or throughout the operating day

- To participate in DA market for market day of 11/1/17
 - Participants must have compliant schedules (Cost 1-12, Price PLS 79, Price 99) in the system by 10/31/17
 - All schedules will be set to Unavailable for market day 11/1
 - Participants will need to set their applicable schedules for 11/1 to Available by 10:30^{**} a.m. on 10/31
 - Participants may differentiate (vary by hour) their Day Ahead offer for the 11/1 market day, and may update in the Rebid period (1:30 to 2:15)*
 - If the participant has indicated they will opt-in to Intraday Offers in their Fuel Cost Policy (and been approved), they may then make real-time hourly updates to their offer beginning after 18:30 on 10/31 (for 11/1)

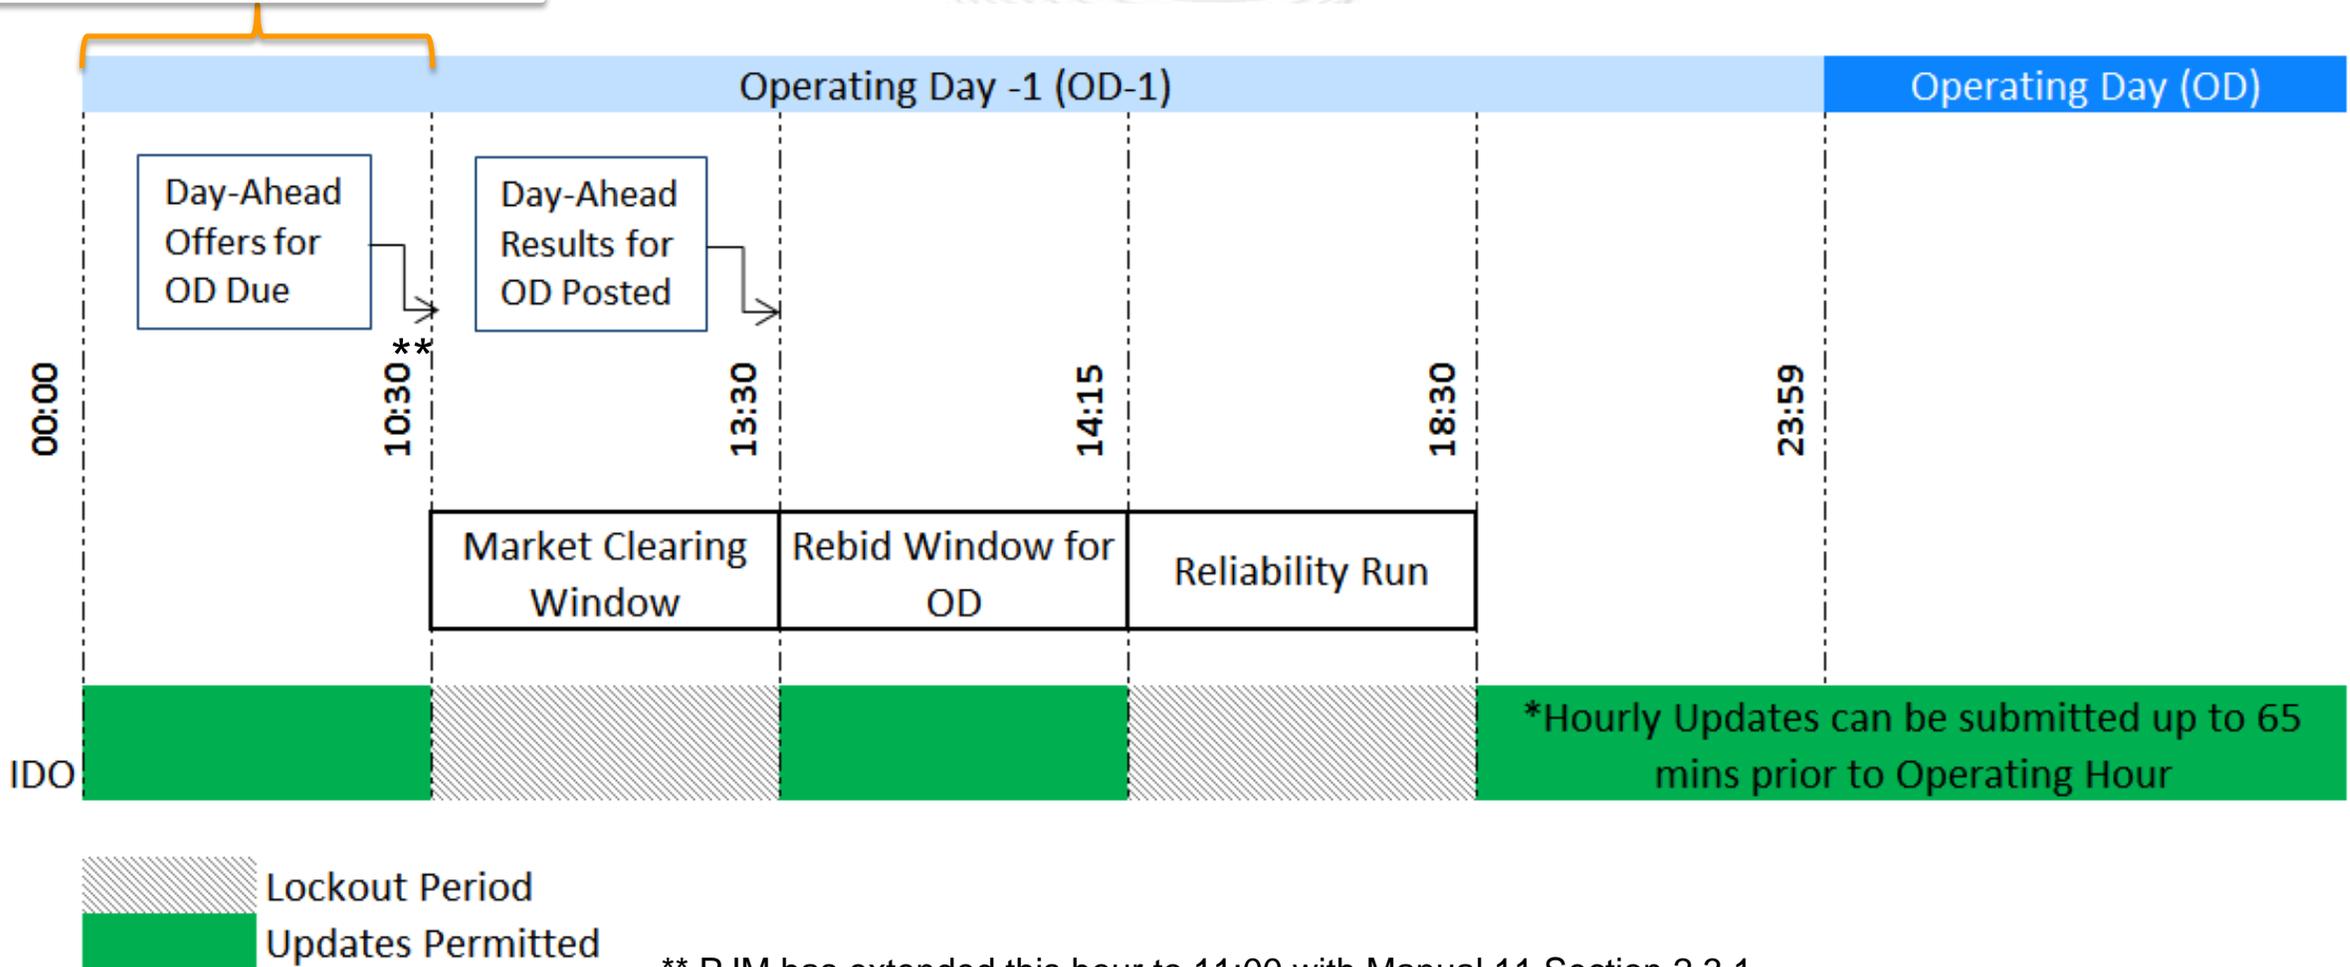

* For opted-out units, updates are locked at the end of rebid for uncommitted units and at the beginning of rebid for committed units

** PJM has extended this hour to 11:00 with Manual 11 Section 2.3.1

Impacts to Day-Ahead Market Offers

Day-Ahead Offer Period

** PJM has extended this hour to 11:00 with Manual 11 Section 2.3.1

- Segmented Ramp Rate will be considered in Day-Ahead Market Clearing starting November 1
- Schedule availability will continue to be designated on a daily basis, however will be able to change offer curves and certain parameters that differ on an hourly basis.
- Parameters include:
 - No Load Cost
 - Startup Cost (Cold, Intermediate, Hot)
- New screens will be added to Markets Gateway to support the hourly differentiated values
 - Offer Updates
 - Detail Updates

- Daily offers and parameters must continue to be submitted
- Hourly differentiated values supersede the daily values on the Offer and/or Detail pages
 - Hourly differentiations are made via the Offer Updates or Detail Updates pages of Markets Gateway
- Hourly differentiated values made on the Offer Updates or Detail Updates pages are not carried over into the next operating day

Updates to Offers during Rebid Period

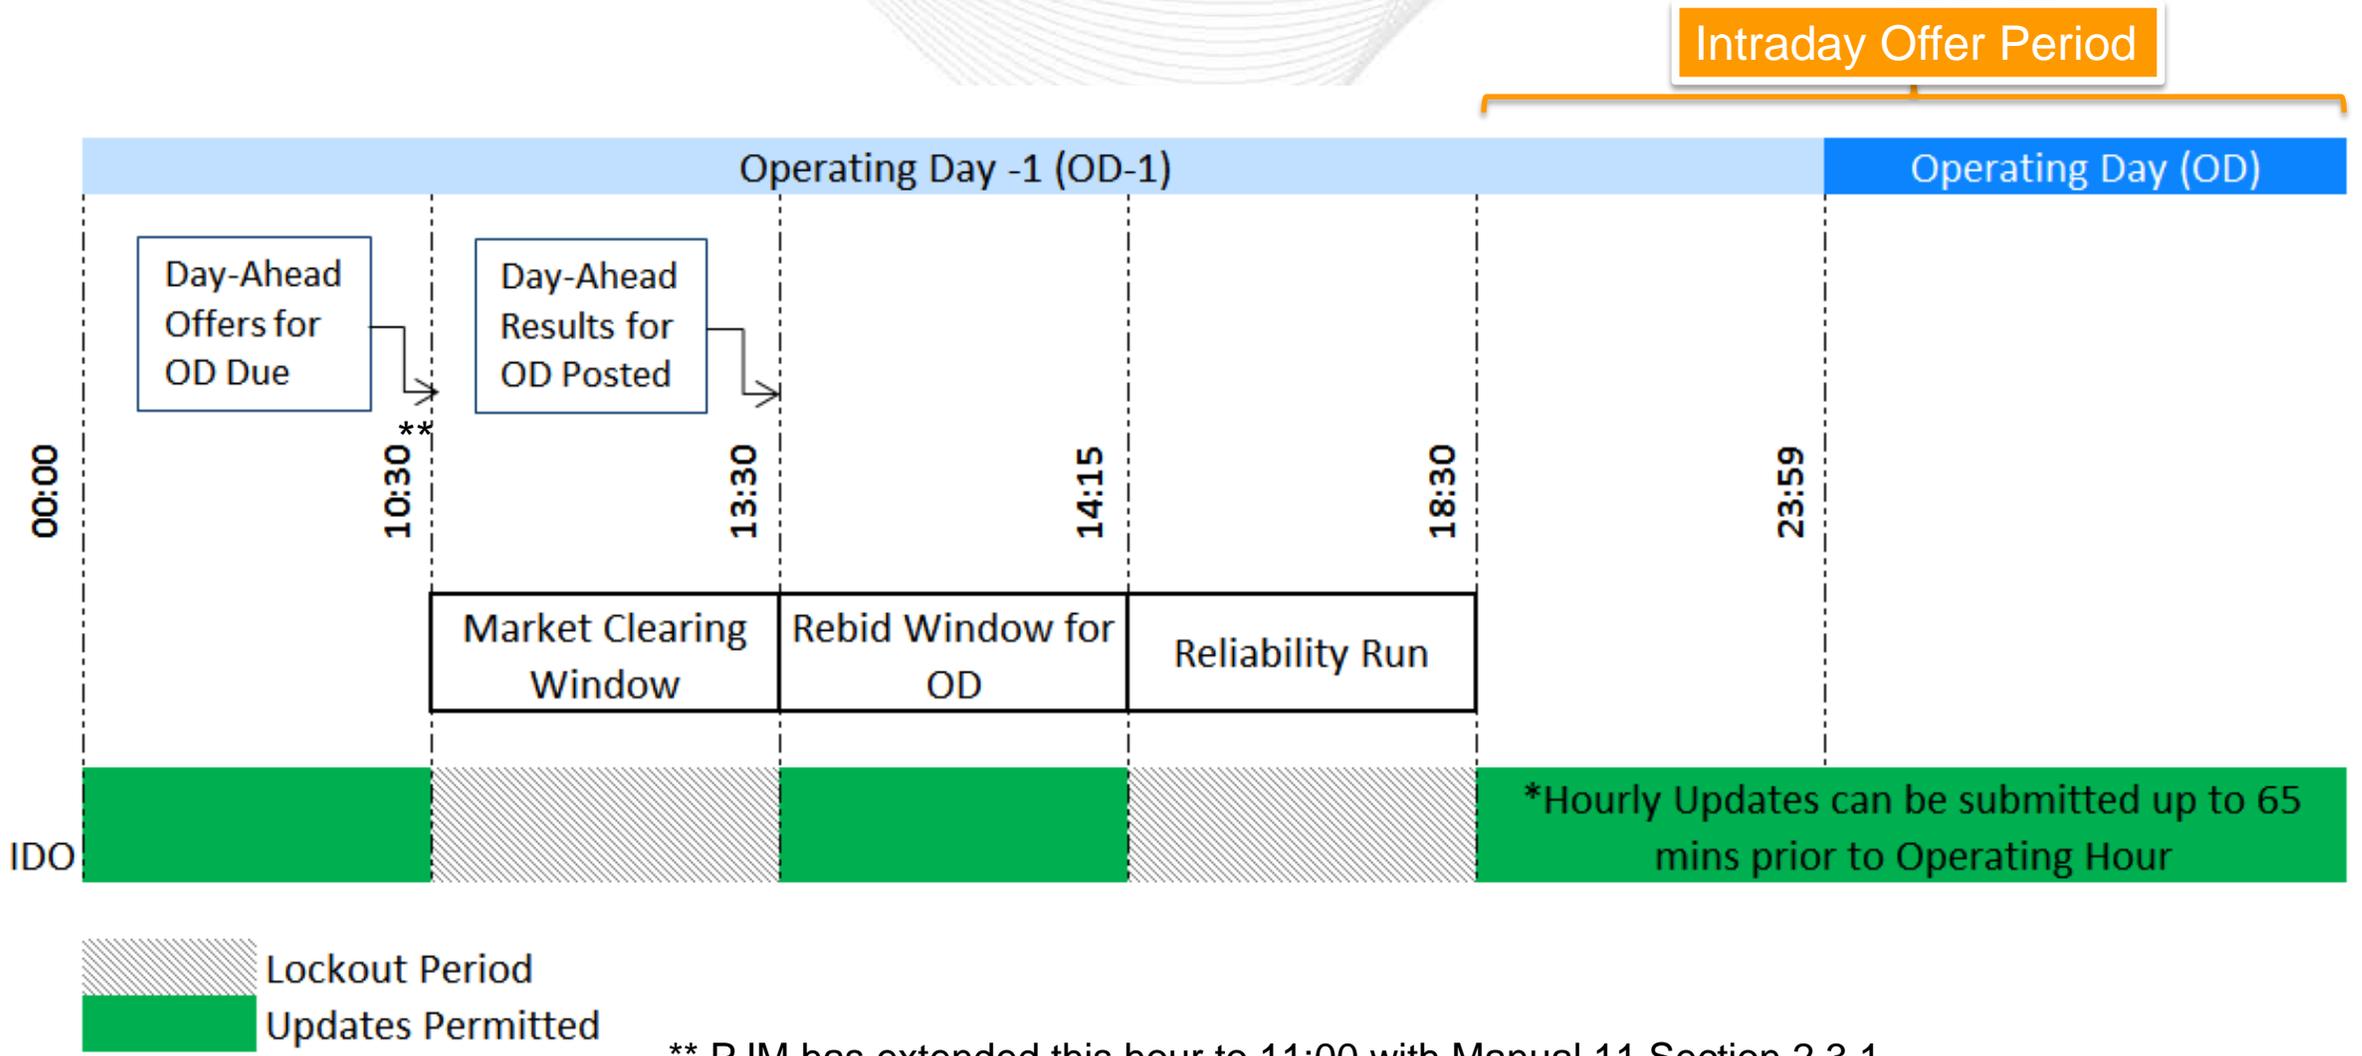

** PJM has extended this hour to 11:00 with Manual 11 Section 2.3.1

		Today	IDO
Committed Day-Ahead	Offer MW	No updates permitted for entire day	No updates permitted for committed hours
	Offer Price	No updates permitted for entire day	Updates permitted to offer price for <u>all</u> hours (price schedule offer price cannot be increased for an hour that is committed)
Not Committed Day-Ahead	Offer MW	Updates may be submitted prior 1415	Updates may be submitted prior 1415
	Offer Price	Updates may be submitted prior 1415	Updates may be submitted prior 1415, and again after 1830

Intraday Updates to Offers

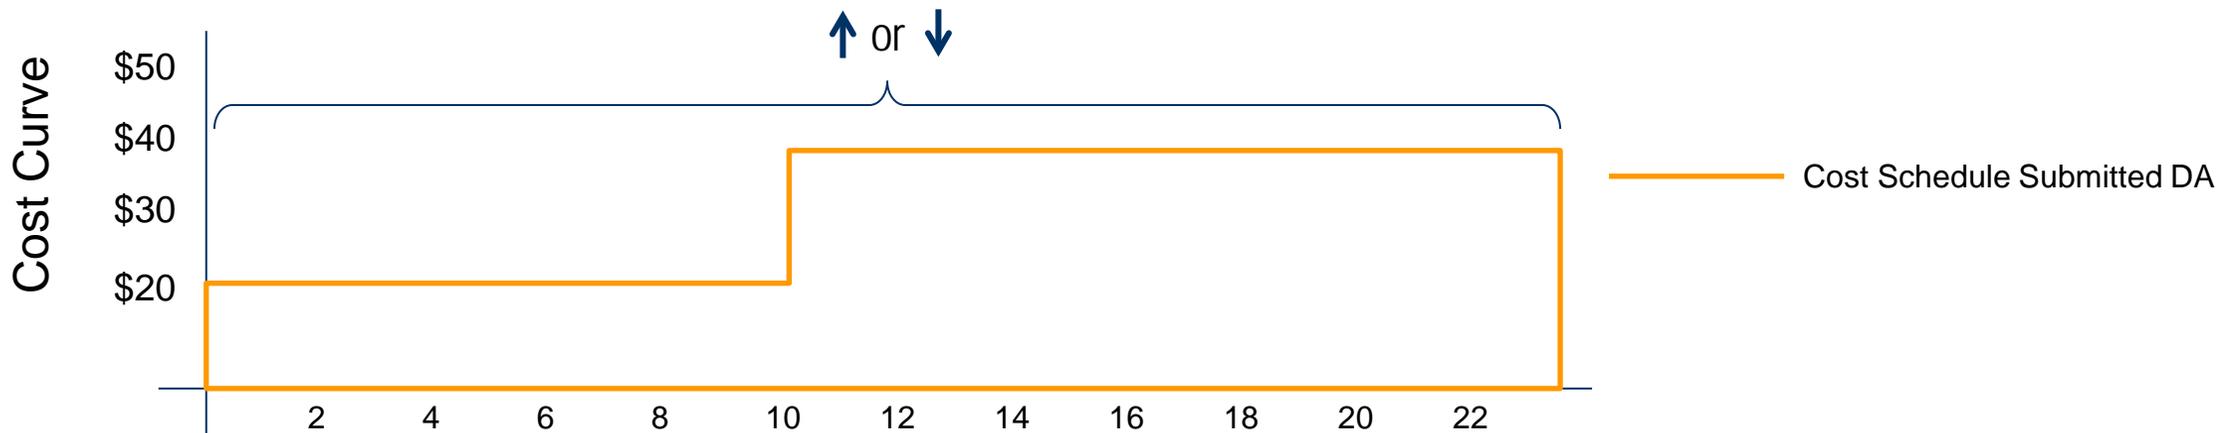

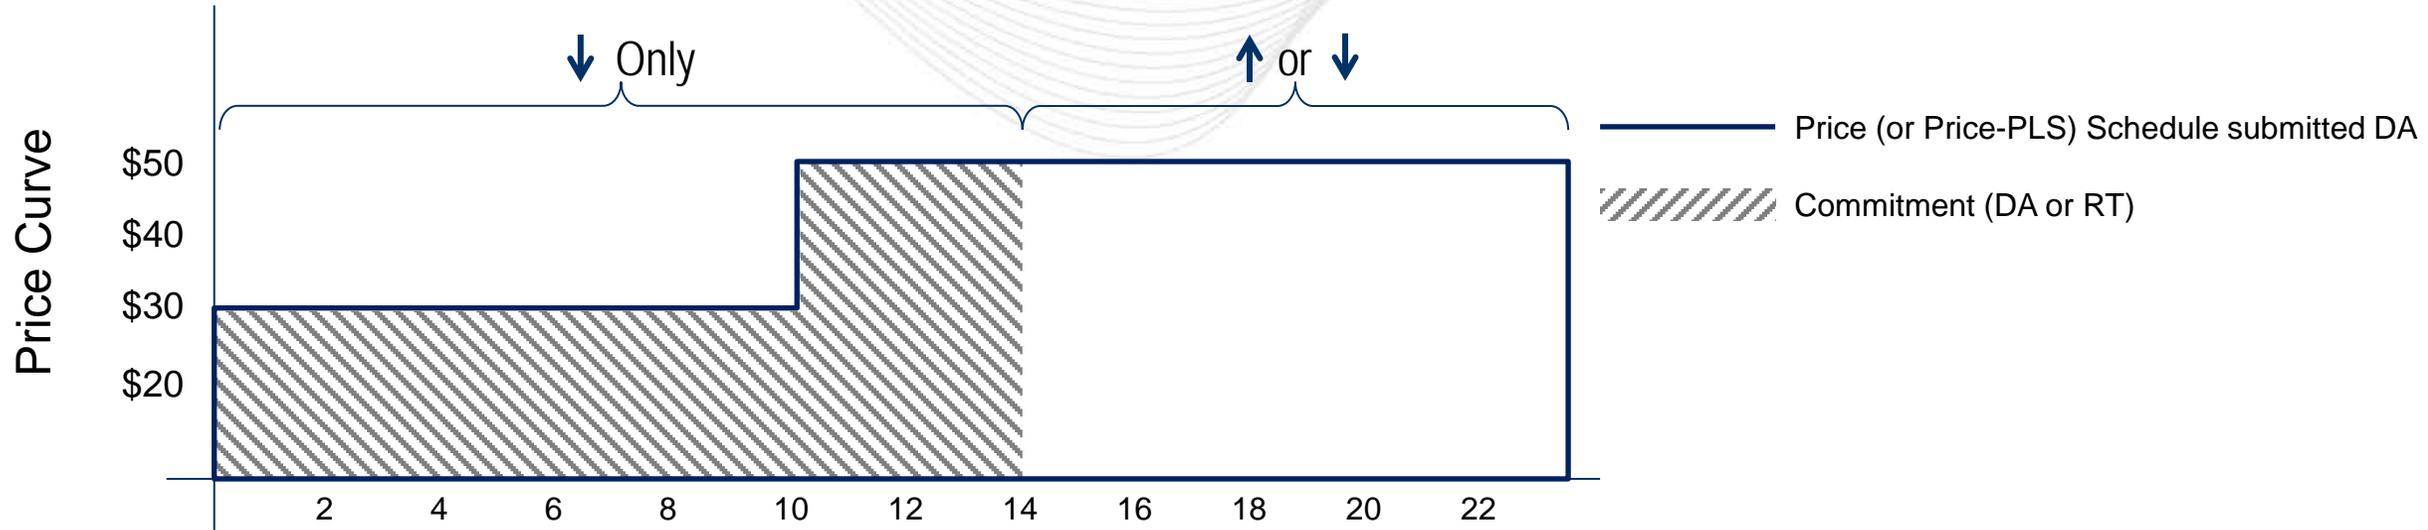

** PJM has extended this hour to 11:00 with Manual 11 Section 2.3.1

- Generation offers can be updated after the Reliability Run is complete, starting at 18:30 up to 65 minutes prior to operating hour
- Potential Updates to Offers include:
 - Price component of the Offer Segment
 - No load and Startup Costs
 - Notification Time
 - Min Run Time
 - Switch to Cost Schedule

Type of Unit	Type of Schedule	Committed Hours	Uncommitted Hours
Cost-Based*	Cost	Increase/Decrease	Increase/Decrease
Price-Based	Price	Decrease	Increase/Decrease
	Cost	Increase/Decrease	Increase/Decrease

*Cost-Based units cannot have a Price-Based schedule

Allowable Real Time Schedule Updates – Price-Based Unit

What Determines a Price Increase?

Price Schedule at Commitment

Segment	MW	Price
1	10	\$5
2	15	\$7
3	20	\$10
4	25	\$15

Update to Price Schedule

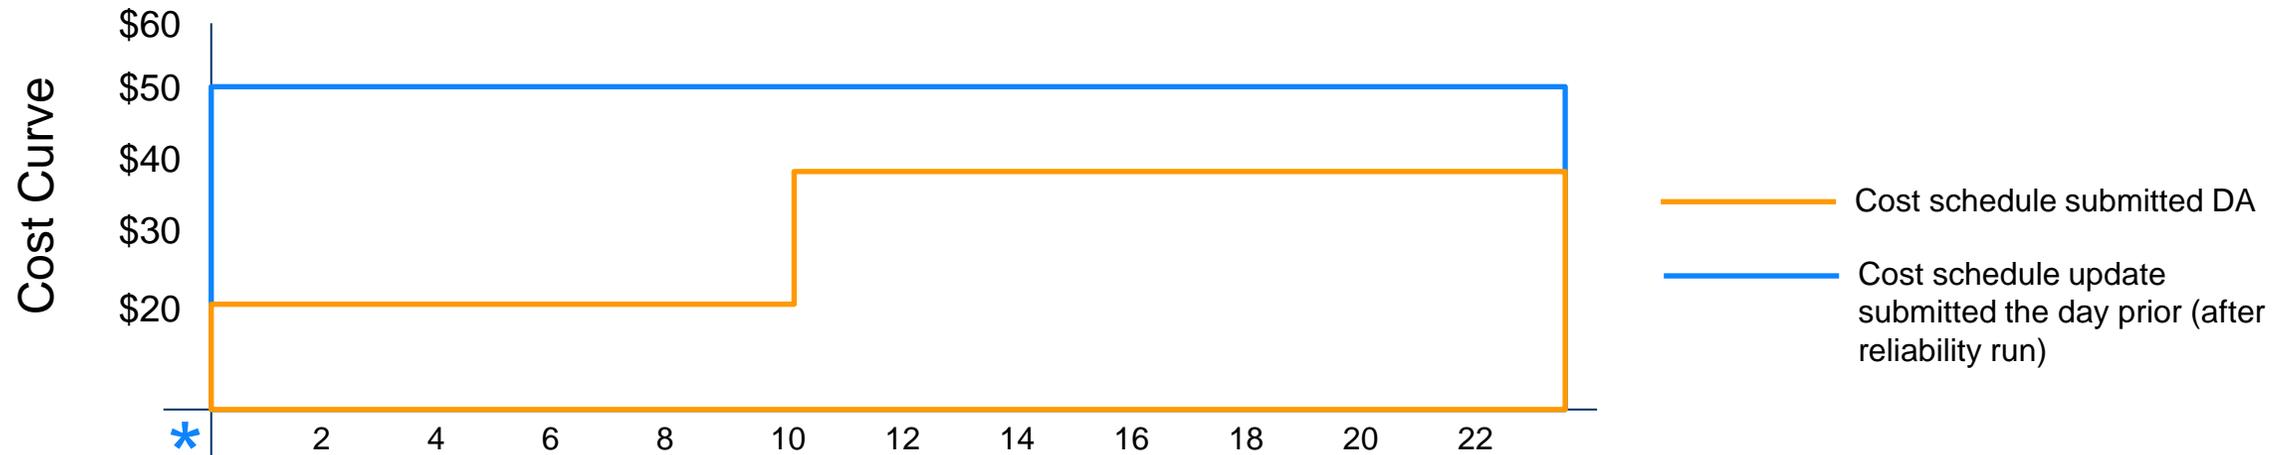

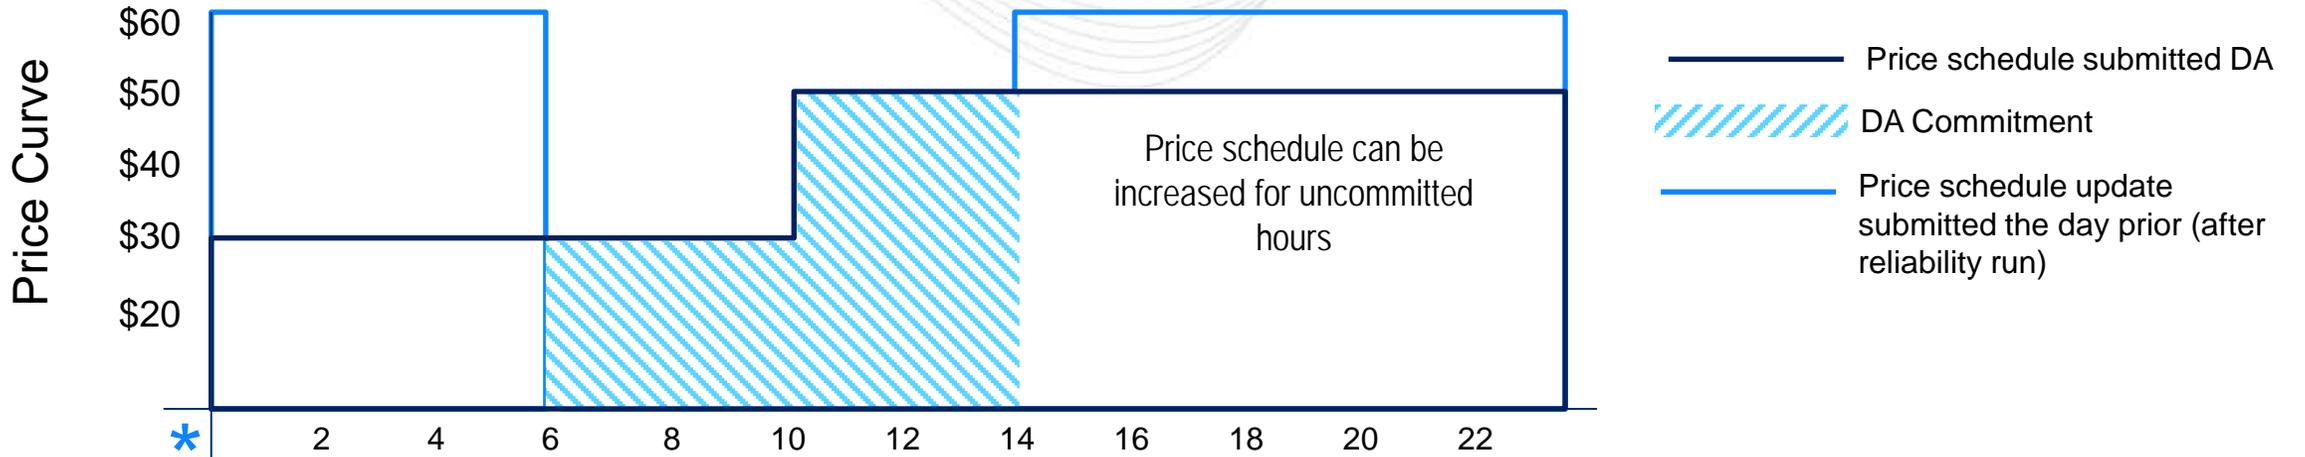

Segment	MW	Price
1	10	\$5
2	15	\$8
3	20	\$10
4	25	\$14

Price increases are determined at the segment level

A decrease in price for one segment does not off-set an increase in another segment

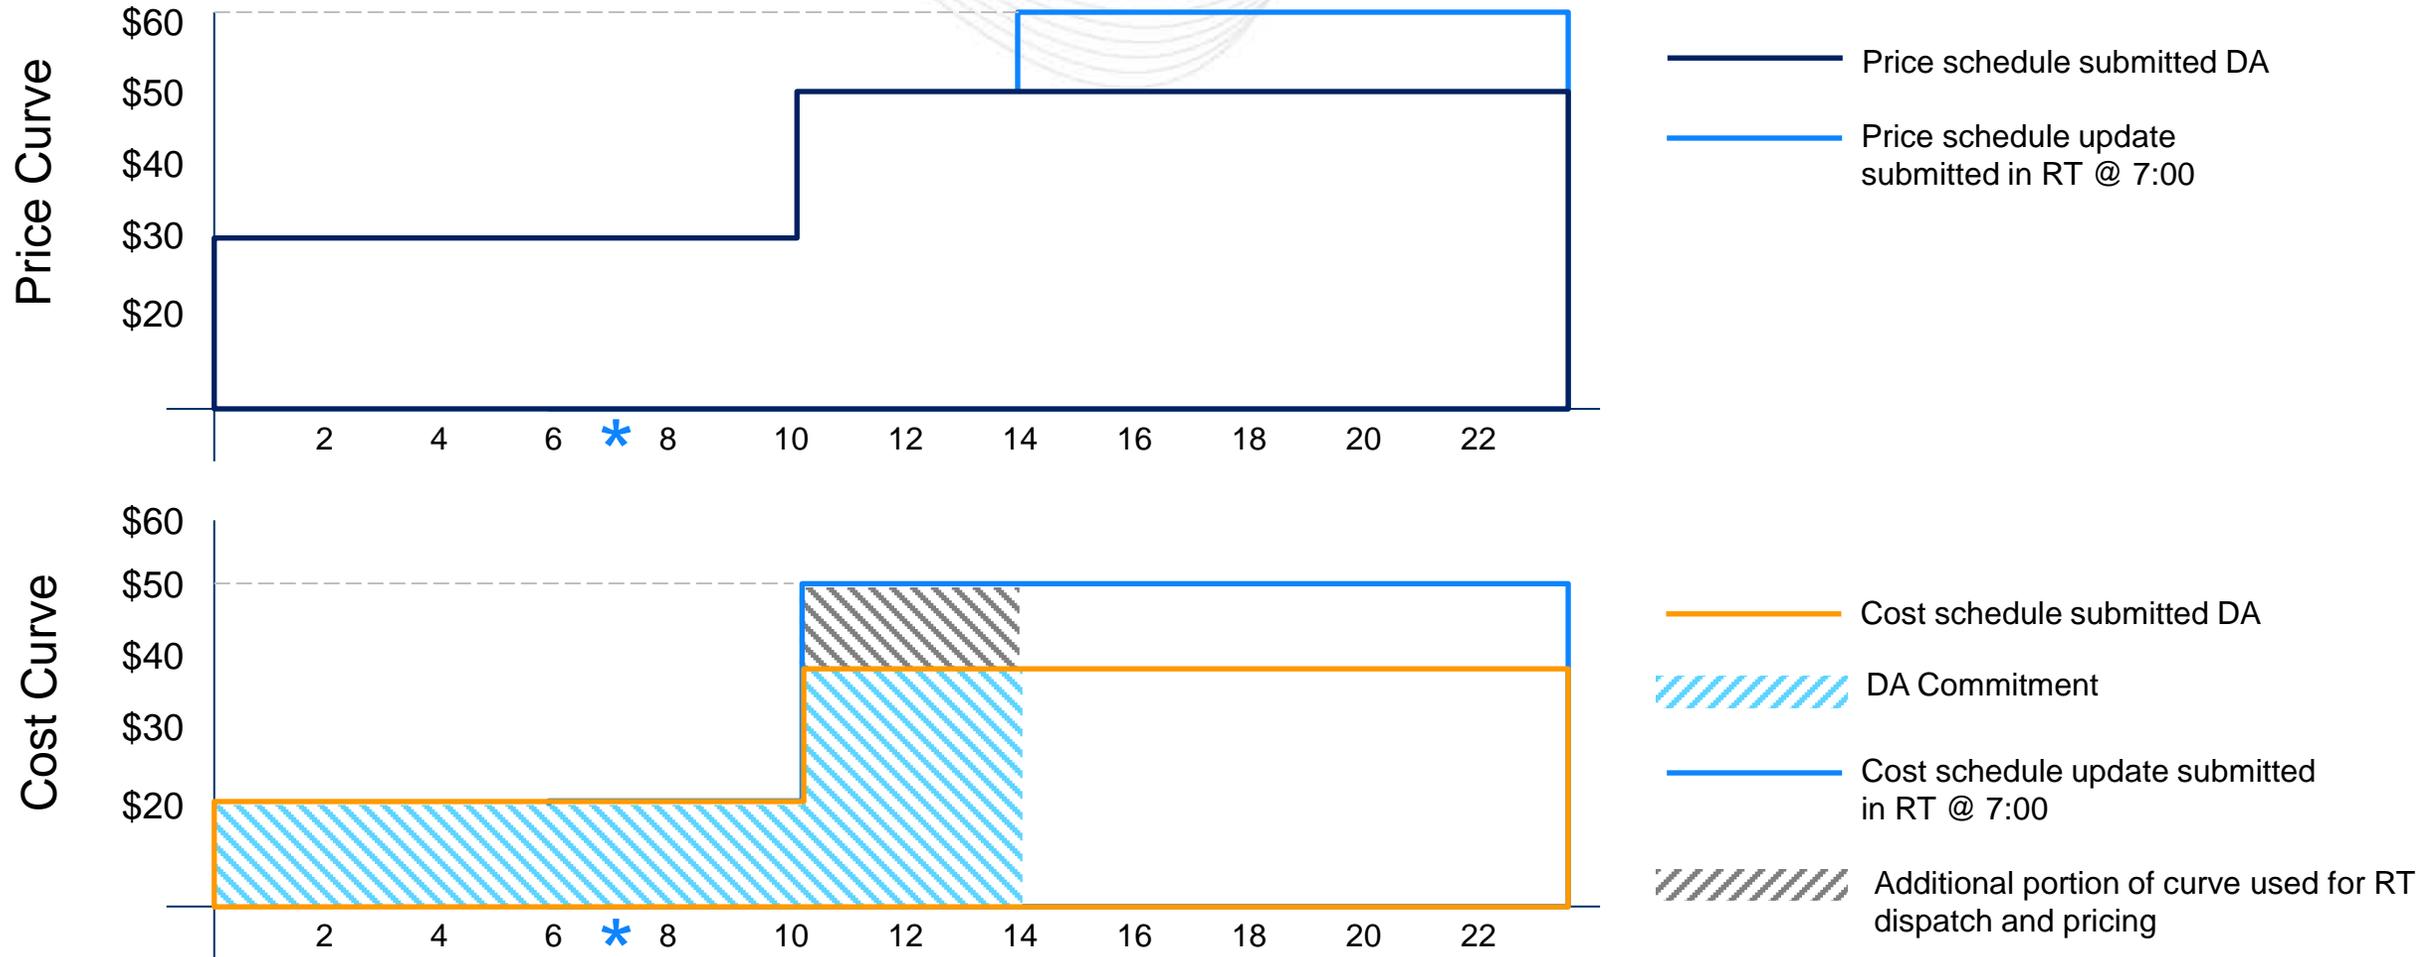

Example 1: Committed on Price – Increase to Offer in RT

Assume cost increases for the entire day after DA market clears

Example 2: Committed on Cost – Increase to Offer in RT

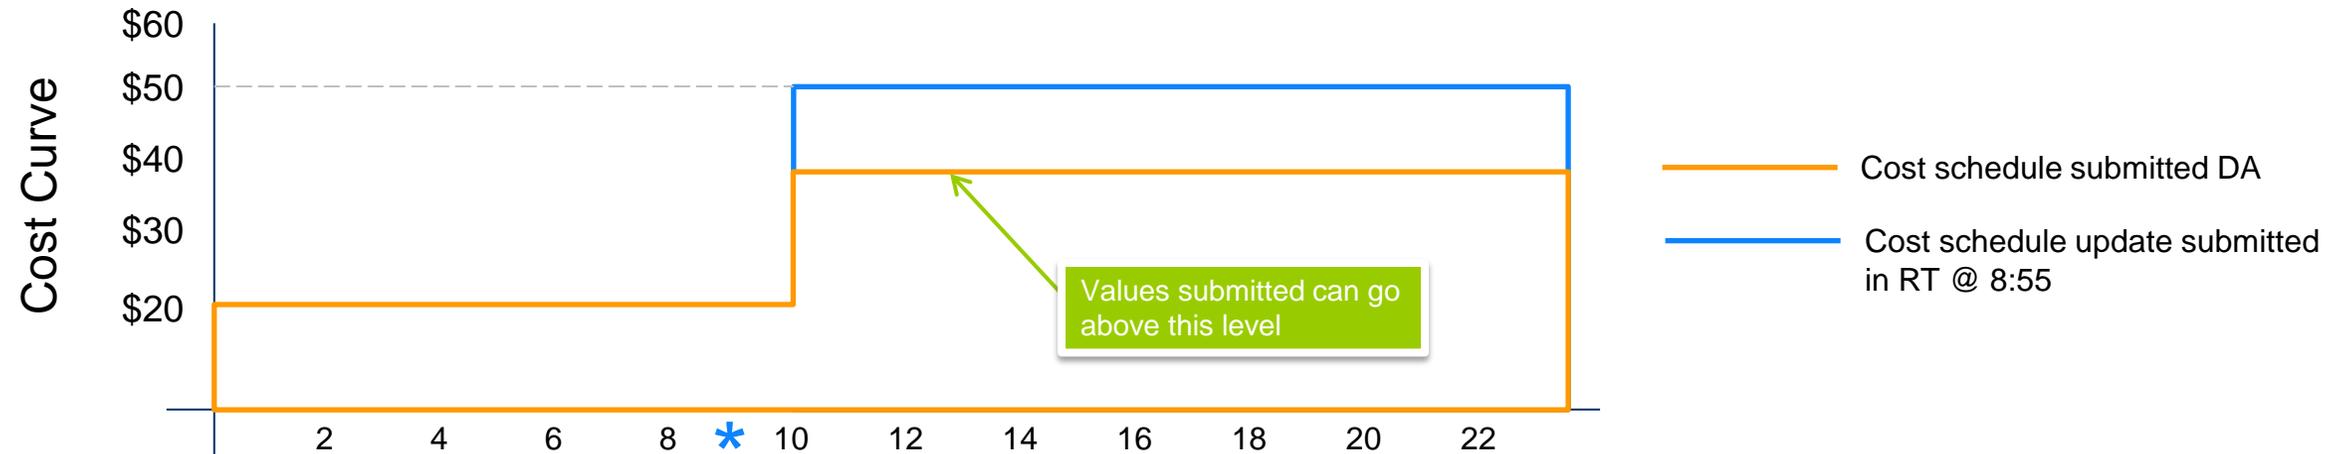

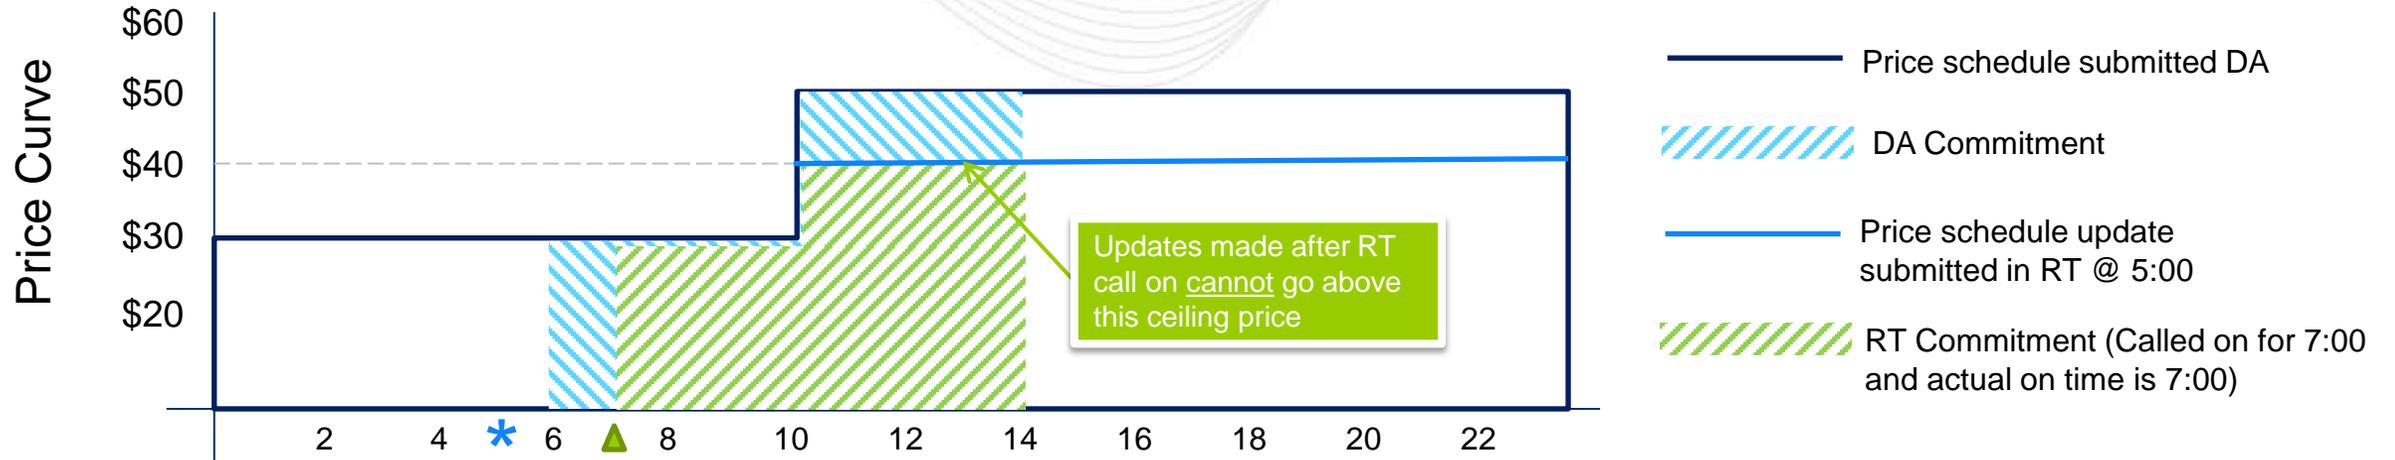

Assume cost increases for hour 10 and beyond

Example: A flexible unit is committed in DA and called on to run in RT

- It updates its price before being called in RT
- The most recent update prior to the commitment becomes the ceiling price
- If for DA the price is \$50, but at RT the price is updated to \$40, then the unit is subsequently committed, \$40 will be the ceiling price

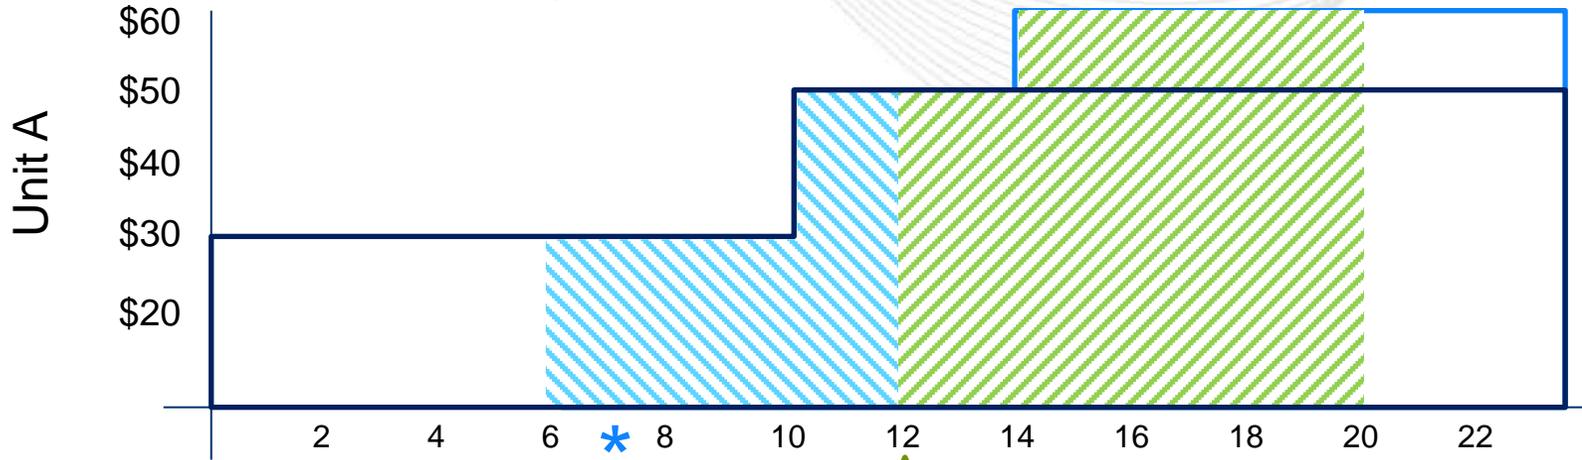

Example 3: Flexible Unit Decreases Offer before RT Call On

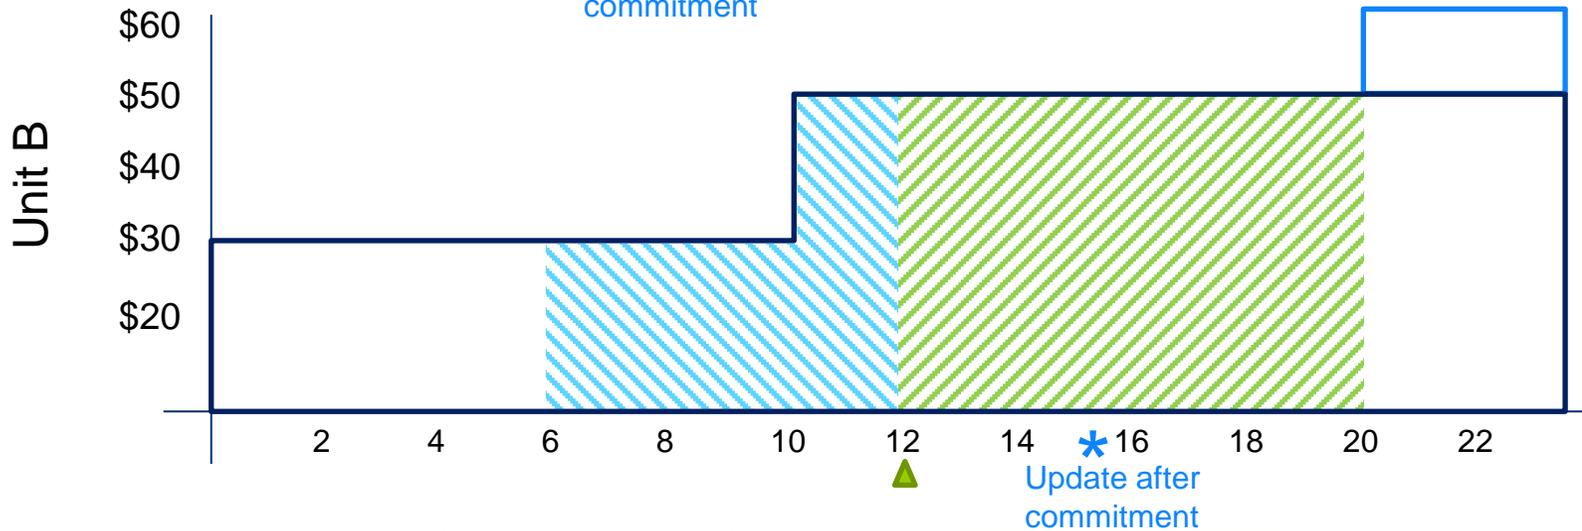

Example 4: CT Increases Price Before vs. After RT Call On

Both units are price-based with min run time = 8 hours

- Price schedule submitted DA
- DA Commitment 6:00 – 14:00
- Price schedule update submitted in RT @ 7:00
- RT Commitment (Called on for 12:00 and actual on time is 12:00)

HB 14-20: Commitment uses latest schedule update

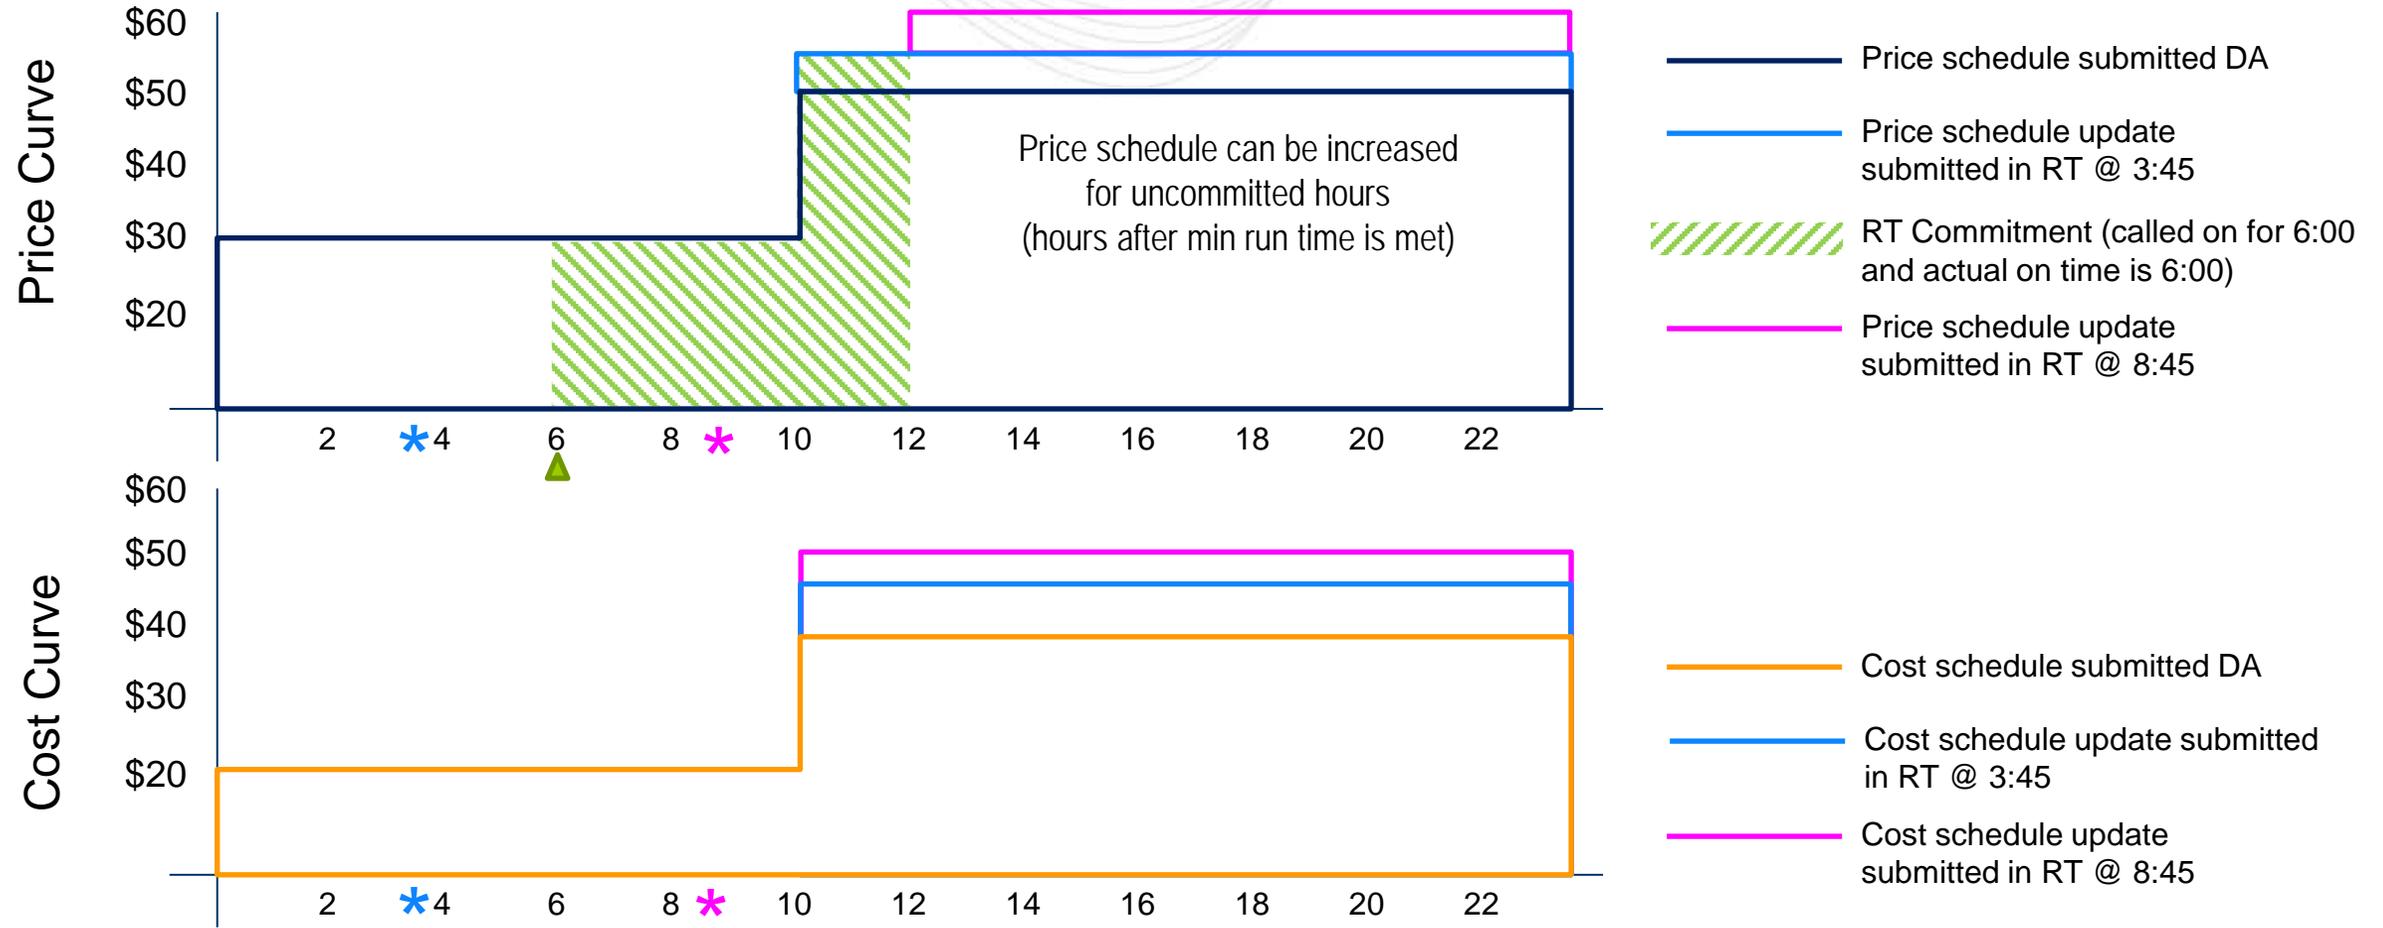

- Price schedule submitted DA
- DA Commitment 6:00 – 14:00
- RT Commitment (Called on for 12:00 and actual on time is 12:00)
- Price schedule update submitted in RT @ 15:55

HB 14-20: Commitment uses latest schedule update (schedule submitted DA)

Example 5: Committed on Price in RT (No DA Commitment)

Unit has a min run time of 6 hours. Assume cost increases for hours 10 and beyond subsequent to DA offer submission. Offer is updated in RT prior to RT commitment. Offer is then updated again in RT after commitment decision is made.

- Units are locked out of increasing Price schedules in Markets Gateway for the duration of their DA commitment
- If commitment is extended in RT, the lockout period will also be extended
- More specific rules for lockout periods exist for flexible units – this will be communicated in a supplemental FAQ document

- Left click on the hour to submit hourly updates for:
 - No Load Cost
 - Startup Costs
 - Min Run Time
 - Notification Time
- If an hour is not populated, will use default values (on Detail screen)

Impacts to Demand Response Resources

- Incremental energy offer price and the shut down cost of a DSR can be updated up to 65 minutes prior to the start of the target hour under the following conditions:

Committed Hours	Uncommitted Hours
Decrease	Increase/Decrease

- Price will be added to the Demand Response > Offer Updates screen
- Shut Down Cost will be added to the Demand Response > Hourly Updates screen

- Hourly Notification Time and Min Down Time Values:
 - Can be submitted up to 65 minutes before the start of the target hour (excluding lockout periods)
 - Updates only used in Reliability Run and Real Time
 - Updated via Demand Response > Hourly Updates screen
 - Min Down Time cannot be updated for committed hours

Hourly Availability Update Deadline	60 minutes prior to Operating Hour	65 minutes prior to Operating Hour

Switch to Cost Functionality

- If a unit is committed on a price schedule and its cost schedule incremental energy offer subsequently exceeds its price schedule value, it may elect to be switched to its cost schedule
 - Unit will be switched to use the cheapest available cost schedule
 - The unit must then stay on its cost schedule for the rest of the Operating Day
 - The price schedule will become unavailable and will not be permitted to be made available again for the rest of the Operating Day

Today (GUCC)

- Elected on “Availability Update” screen
- Elect between 1830 and 2100 the day before
- Election does not propagate to subsequent market days

Intraday Offer Implementation

- Elected on “Detail Updates” Screen
- Elect prior to DA, during Rebid Period, or between 1830 the day before and 65 minutes prior to operating hour
- Election does not propagate to subsequent market days

- Check “Switch to Cost Schedule” box
- Select Start Hour
- By selecting Switch to Cost in Day Ahead or Real Time, Price-based and Price-PLS schedules will be set to Unavailable

Managing Dual-Fuel Units Intraday

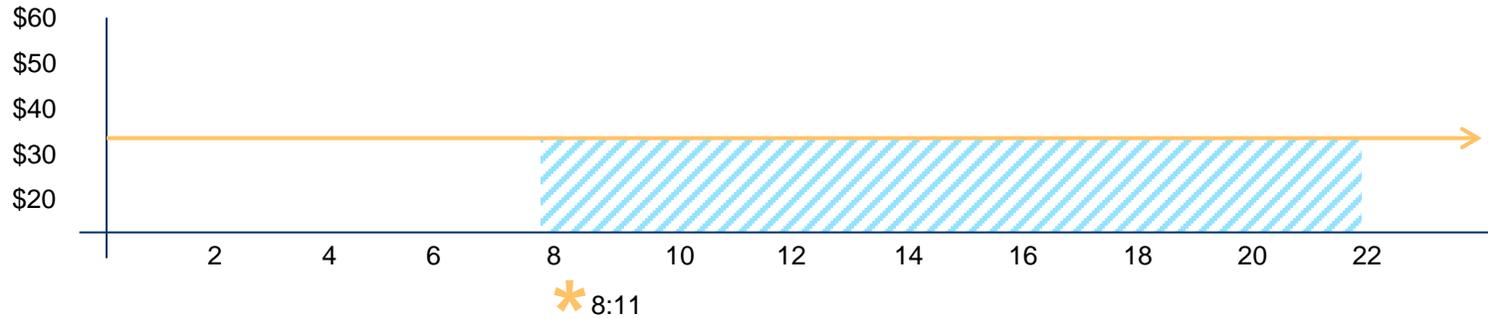

- Situations may arise for Dual Fuel units when a fuel switch is required
- If a unit is designated as Dual Fuel on the Generator>Unit>Detail tab in Markets Gateway, schedule availability may be changed hourly throughout the operating day
 - May be changed in Real Time only, between 1830 the day before and 65 minutes before the operating hour
 - For cost schedules only
 - Price schedule remains Available (note: changing Availability does not imply switch to cost)
 - Schedule may be changed from Available to Unavailable, and vice versa, as needed
 - One cost schedule per fuel type may be Available at any one time
 - Can be changed for hours in which a schedule is not committed

— Price schedule (gas) submitted DA (\$40)

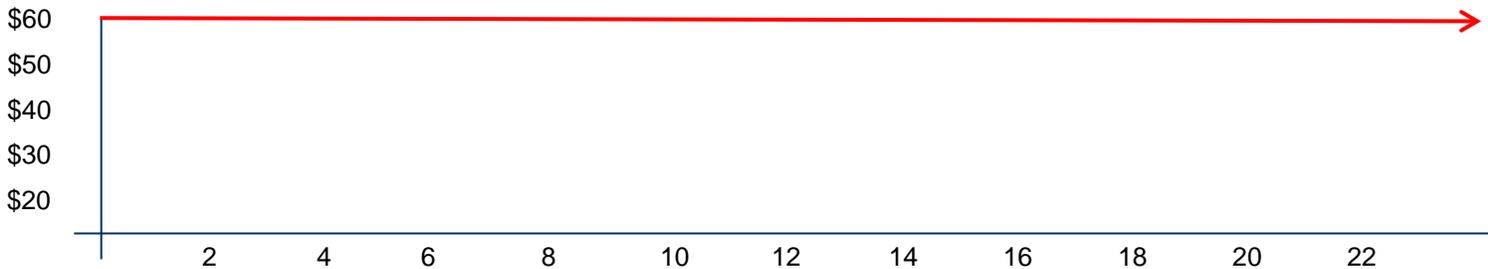

▨ DA Commitment

— Cost schedule (gas) (\$35)

* 8:11 – Determine 2 hrs. of gas remains

Gas cost schedule availability cannot be updated for committed hours. Call to Dispatch required

— Cost schedule (oil) (\$60)

Three Pivotal Supplier Test

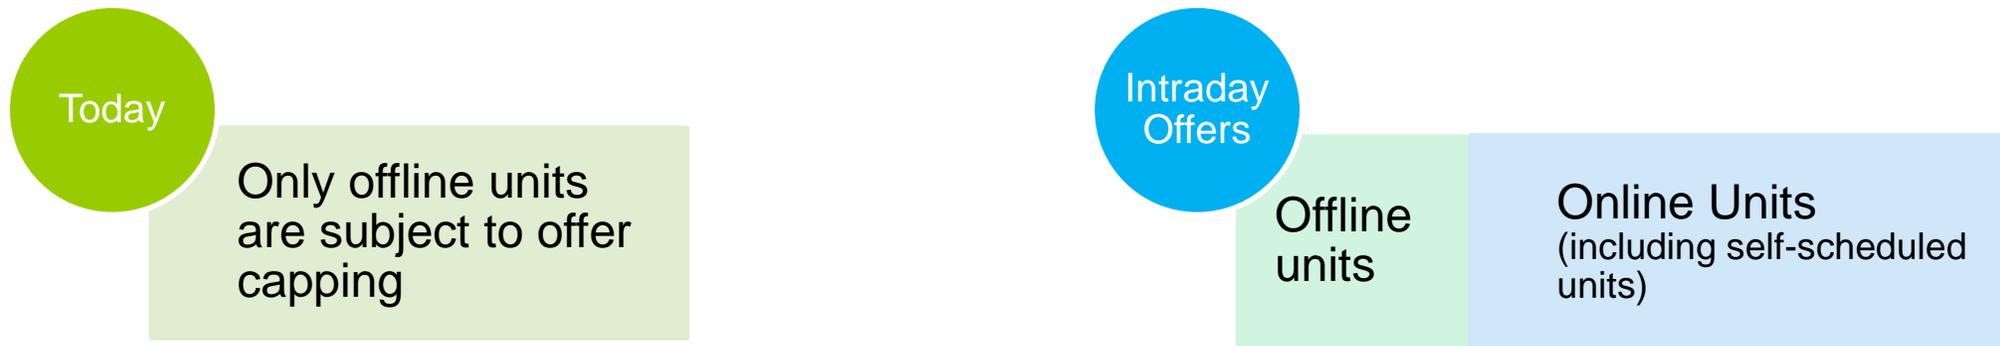

- The TPS test is a test for structural market power. The test examines the concentration of ownership of the supply compared to the level of demand
- PJM utilizes the Three Pivotal Supplier (TPS) Test to mitigate market power for:
 - Transmission Constraints
 - Regulation Market
 - RPM

- A test failure means that the ownership of the required supply is concentrated among few suppliers:
 - Those suppliers have the potential to exercise market power (structural market power)
 - It does not mean those suppliers are attempting to exercise market power
 - A test failure triggers mitigation as a preventative step in the event of a concentration of ownership
- Resources that fail TPS are placed on the cost or price schedule that results in the lowest overall system production cost (DA Market) or the lowest dispatch cost (RT Market). This is referred to as offer capping.

- DA TPS will be updated to consider hourly differentiated offers in the TPS test evaluation
- “Must run” resources will be included in the evaluation and subjected to mitigation
- TPS testing performed for binding transmission constraints

Three Pivotal Supplier Test (RT)

- Real-time energy TPS testing is performed in the ITSCED application for binding transmission constraints
- Currently, TPS testing is performed for offline units only, as part of the RT unit commitment process
- Under Intraday Offers
 - there will be no change to the TPS process for offline resources.
 - there will be an online unit TPS test performed following the completion of either the DA commitment period, or the min run time if the unit was committed in real-time
- For the online resources that have met their commitment period, TPS testing will occur every hour until they are released
- For self-scheduled units committed in the Real-time Market (and not in the Day-Ahead Market), the TPS test will be performed after min run time is met and occur every hour until the resource comes offline

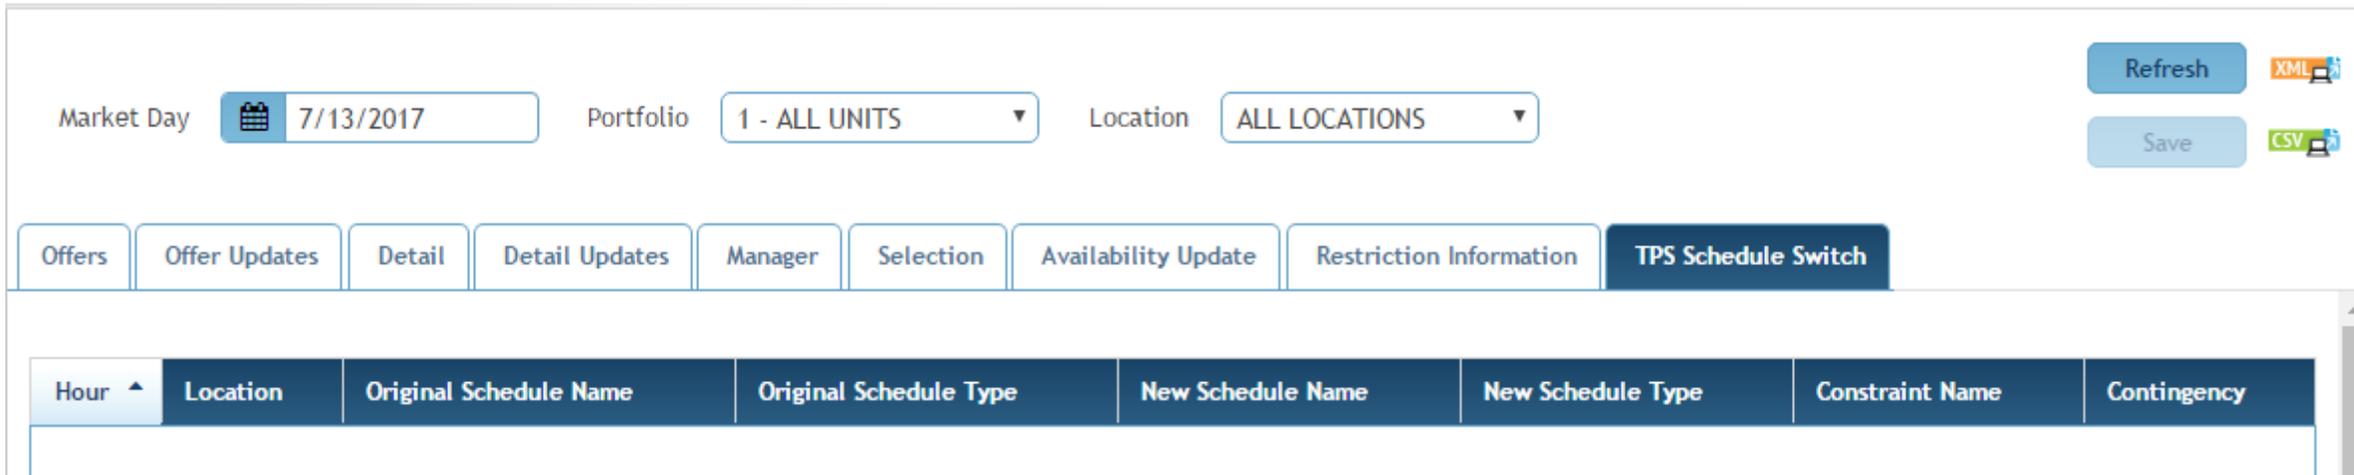

- Units running in real-time beyond completion of either the DA commitment period, or the min run time if the unit was committed in real-time will be subject to evaluation for market power on an hourly basis and will be offer capped as follows:
 - Units operating on a price-based schedule whose owner passes the TPS test will not be offer capped and will remain on the price-based offer.
 - Units operating on a price-based schedule whose owner fails the TPS test will be offer capped.
 - Units operating on a cost-based schedule will remain on that schedule regardless of the results of the TPS test.

- Offer capped resources will remain offer capped until the earlier of:
 - End of the day
 - Unit is released
 - Start of its next pre-existing commitment
 - Applies to units cycled in the day-ahead commitment or brought online in real-time prior to day-ahead commitment

Visibility into Online TPS Offer Capping

- Participants will be notified of offer capped units via a new screen in Markets Gateway (Generator>Schedule>TPS Schedule Switch)
- Will display units offer capped as a result of the Real Time Online TPS test
- Information will be updated starting 20 minutes prior to the upcoming operating hour
- Data can be downloaded via XML

Offers Offer Updates Detail Detail Updates Manager Selection Availability Update Restriction Information **TPS Schedule Switch**

Hour	Location	Original Schedule Name	Original Schedule Type	New Schedule Name	New Schedule Type	Constraint Name	Contingency
------	----------	------------------------	------------------------	-------------------	-------------------	-----------------	-------------

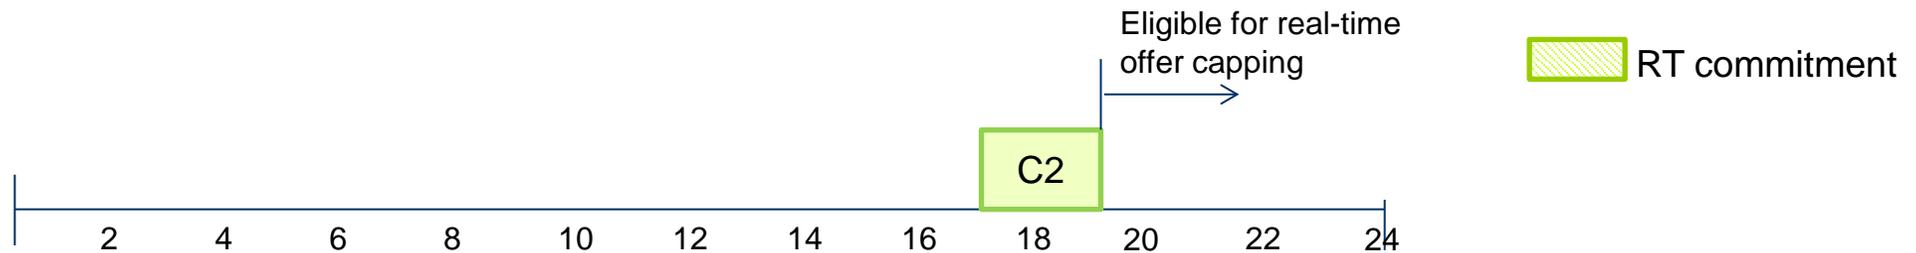

- Resource has 2 available schedules: Price and Cost
 - Price Schedule dispatch cost = \$50
 - Cost Schedule dispatch cost = \$40
- Resource committed in DA Market, resource owner passes the DA TPS test. Not offer capped.
- Resource will remain on the cost schedule until the earlier of the end of the day or when it is released

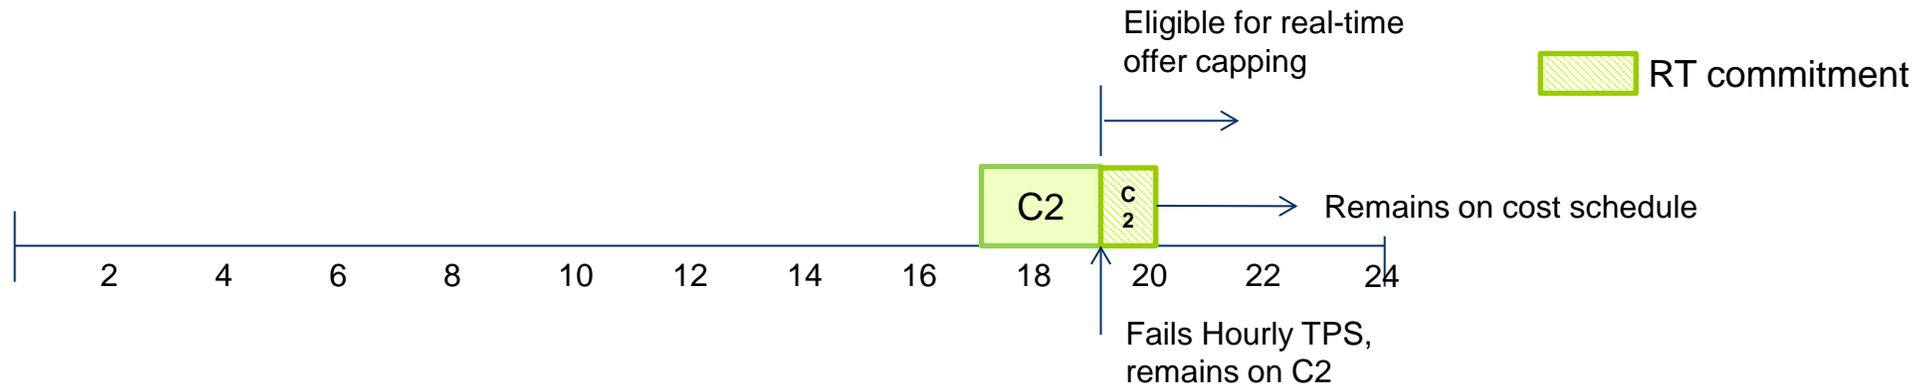

- Resource has 3 available schedules: Price, Cost 1 and Cost 2
 - Price Schedule dispatch cost = \$50
 - Cost 1 Schedule dispatch cost = \$40 **\$55**
 - Cost 2 Schedule dispatch cost = \$45
- Resource committed in DA Market, resource owner failed the DA TPS test. Resource offer capped on the Cost 1 schedule.

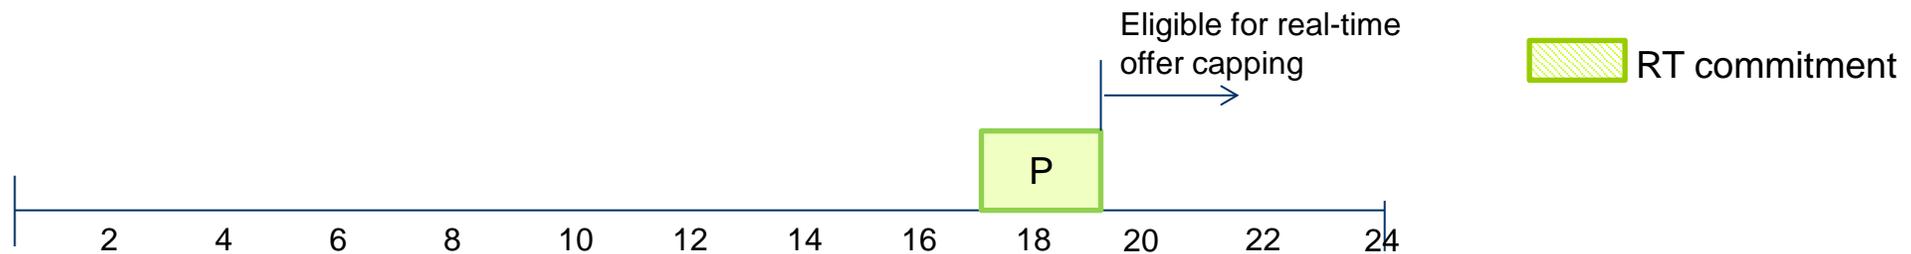

- Resource committed in Real Time
- Resource has a 2 hour min run time
- Resource has 3 available schedules: Price, Cost 1 and Cost 2
 - Price Schedule dispatch cost = \$50
 - Cost 1 Schedule dispatch cost = \$45
 - Cost 2 Schedule dispatch cost = \$40
- Resource committed in real-time starting in HE17 on Cost Schedule 2 since owner fails TPS test at the time of commitment decision

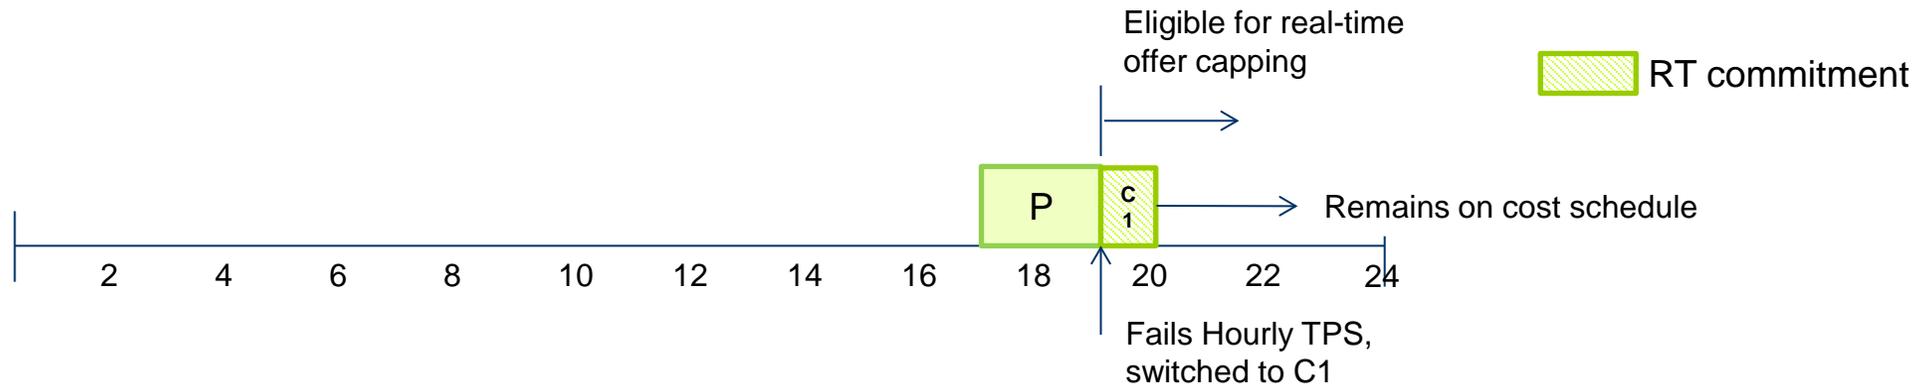

- Participant makes updates to the Cost 2 schedule in real time after being committed
 - Price Schedule dispatch cost = \$50
 - Cost 1 Schedule dispatch cost = \$45
 - Cost 2 Schedule dispatch cost = ~~\$40~~ **\$50**

- Resource committed in Real Time
- Resource has a 2 hour min run time
- Resource has 3 available schedules at the time of commitment: Price, Cost 1 and Cost 2
 - Price Schedule dispatch cost = \$35
 - Cost 1 Schedule dispatch cost = \$45
 - Cost 2 Schedule dispatch cost = \$40
- Resource committed in real-time HE17 on the Price schedule since the owner fails the TPS test at the time of commitment and Price is the cheapest available schedule.

- Participant makes updates to the Cost 1 schedule in real-time after being committed
 - Price Schedule dispatch cost = \$35
 - Cost 1 Schedule dispatch cost = ~~\$45~~ \$30
 - Cost 2 Schedule dispatch cost = \$40

- Based on discussions between PJM and the IMM the following changes to TPS rules are being proposed and brought through the stakeholder process for endorsement
 - Resources self scheduled in real time will be online TPS tested and subject to mitigation after the first hour of operation
 - Resources which fail TPS test in DA or RT and are mitigated on their Price Schedule will be subject to re-evaluation of the offer cap level if any part of their three part offer is updated for a committed hour subsequent to commitment

BREAK

Impacts to Market Settlements

- Intraday Offers has impacts on the following Market Settlement areas:
 - Operating Reserve Credits
 - Day-Ahead Operating Reserve Credits will use hourly differentiated offer
 - Balancing Operating Reserve Credits have changes to the version of schedule to which a resource will be made whole and changes in the balancing value portion of the calculation
 - Lost Opportunity Cost Credits
 - Changes to the version of the schedule on which a resource will be compensated

- **Committed Offer**
 - The offer on which a resource was scheduled for a particular clock hour
- **Real Time Offer**
 - Any update to an existing offer made after the close of the Day-Ahead offer period
- **Final Offer**
 - The offer on which a resource was dispatched by the Office of the Interconnection for a particular clock hour for the Operating Day

- Purpose is to cover costs represented in Resource offers
 - Results in prices and compensation that preserves the incentive for generation and Demand Resources to follow real-time dispatch signals/instructions
- The total resource offer amount for generation, including startup and no-load costs as applicable, is compared to its total energy market value for specified operating period segments during the day
 - If the total value is less than the offer amount, the difference is credited to the PJM Member.

- Balancing Operating Reserve Credit =
Real Time Offer¹ – Balancing Value² – DA Value – DA Operating Reserve Credit – Any Sync/Non Sync/Reactive/DASR revenue

¹Real Time Offer = Energy Offer + including startup and no-load costs as applicable

²Balancing Value = (RT MW³ – DA MW) * RT LMP

³Greater of:

- RT MW
- Lesser of: Desired MW and DA MW

- The Balancing Value accounts for the difference in Real Time output compared to the Day-Ahead commitment valued at the RT LMP
- Increases to offer prices after commitment would result in units being dispatched down
 - As a result the unit has to buy back energy in Real Time
 - Absent a change, this behavior could result in a BOR Credit due to the balancing value going negative

Existing Balancing Value Illustration

Segment	Day-Ahead		Final RT Offer	
	MW	Price	MW	Price
1	50	5	50	10
2	100	10	100	15
	DA LMP = \$10, DA Scheduled MWh = 100 MW		RT LMP = \$10, RT Dispatch Desired MWh = 50 MW	

RT Generation MW = Greater Of:

RT Generation MWh
= 50 MW

Lesser of:

RT Dispatch Desired
MWh = 50 MW

DA Scheduled MWh
= 100 MW

= 50 MWh

= 50 MWh

Balancing Value =

$$(\text{RT Generation MW} - \text{DA Scheduled MW}) * \text{RT LMP}$$

$$(50 \text{ MW} - 100 \text{ MW}) * \$10$$

$$= -\$500$$

A negative balancing value results in an increased Balancing Operating Reserve Credit

Adjusted Balancing Value Illustration

Segment	Day-Ahead		Final RT Offer	
	MW	Price	MW	Price
1	50	5	50	10
2	100	10	100	15
	DA LMP = \$10, DA Scheduled MWh = 100 MW		RT LMP = \$10, RT Dispatch Desired MWh = 50 MW	

RT Generation MW = Greater Of:

RT Generation MWh
=50 MW

Lesser of:

Greater Of:

RT Dispatch Desired MWh = 50 MW

Committed Offer Desired MWh = 100 MW

=100 MW

DA Scheduled MWh = 100 MW

=100 MWh

= 100 MWh

Balancing Value =

$$(\text{RT Generation MW} - \text{DA Scheduled MW})$$

* RT LMP

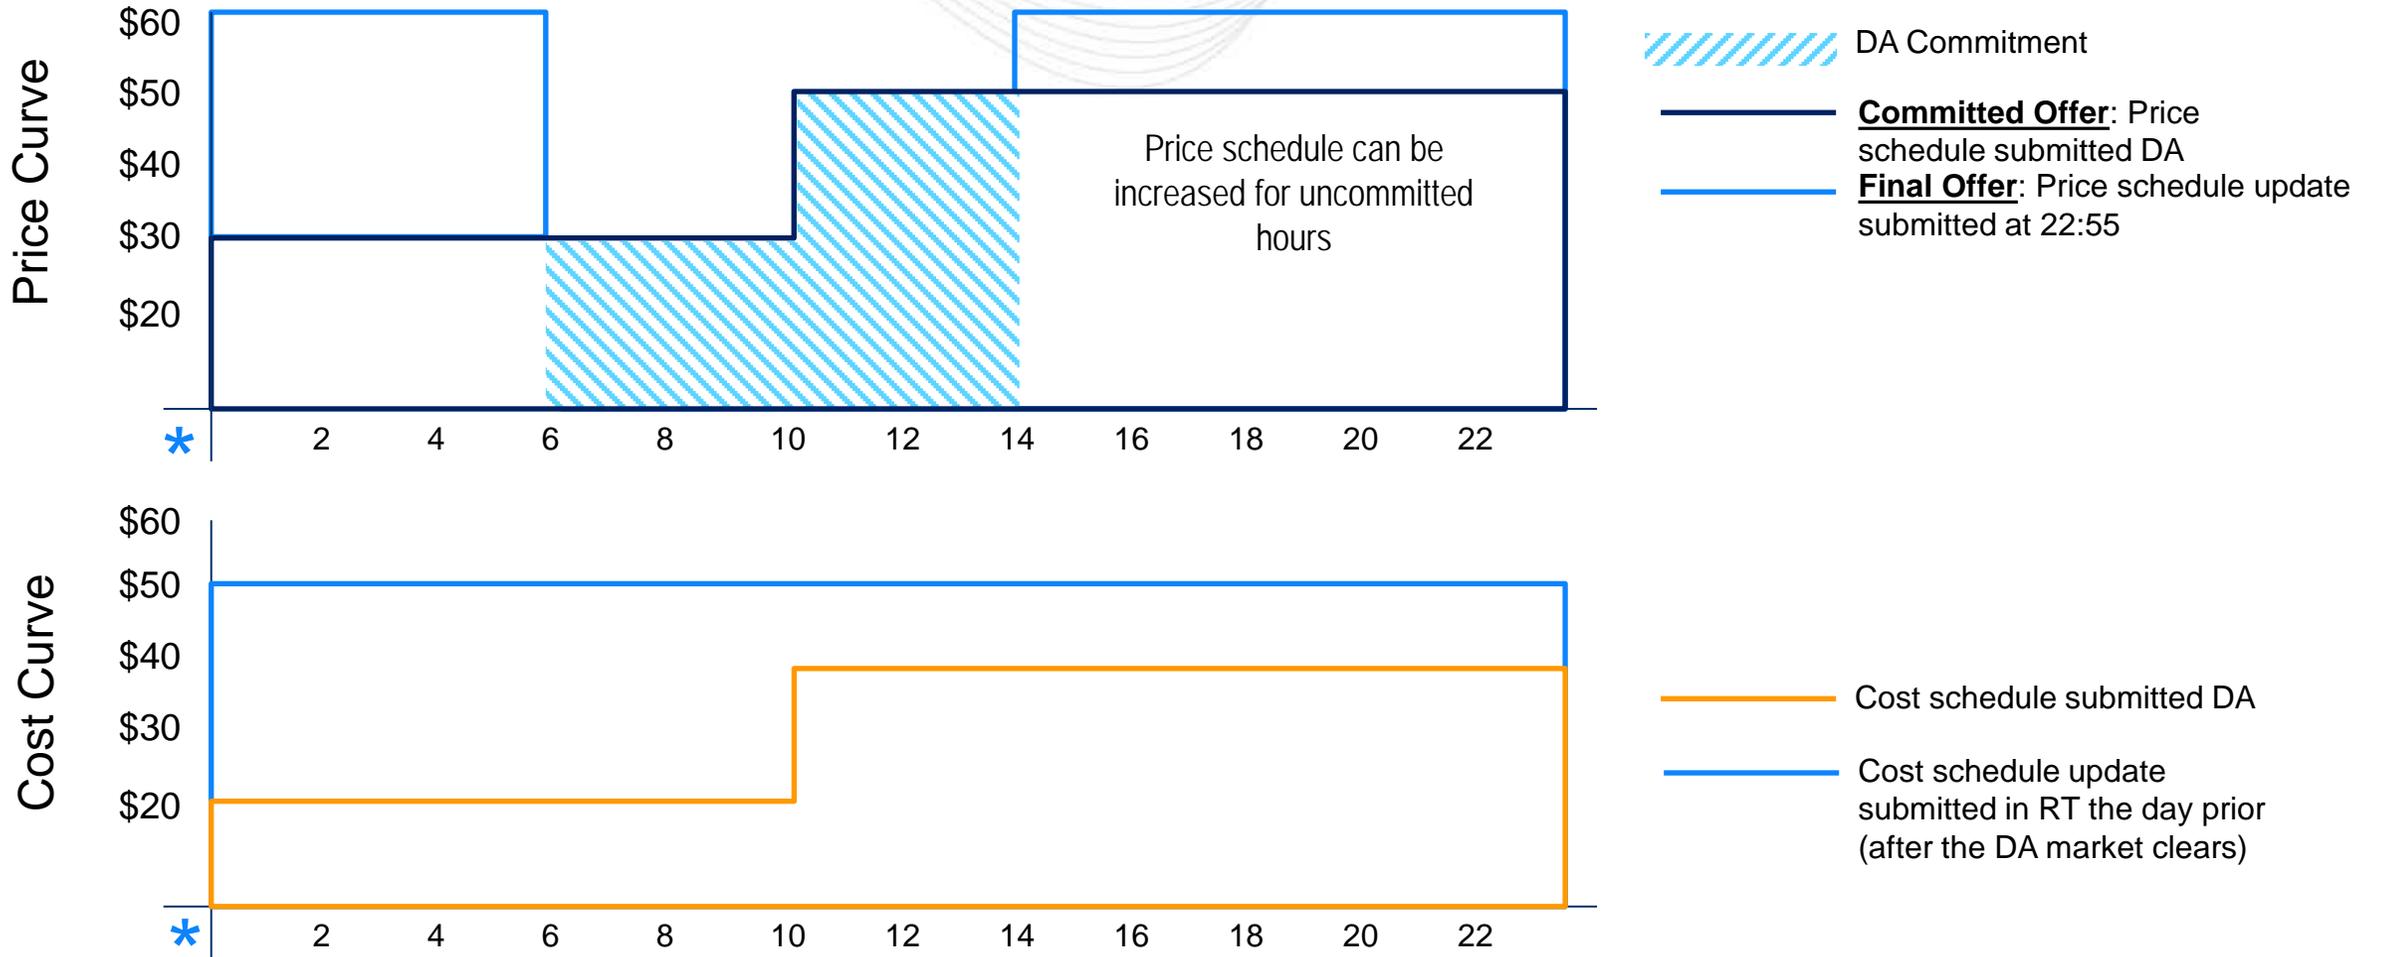

$$(100 \text{ MW} - 100 \text{ MW}) * \$10 = \$0$$

- Balancing Operating Reserve credits are calculated by operating segment within an Operating Day.
- A resource will be made whole for two periods for each synchronized start
 - The two periods are as follows:
 1. greater of the DA Commitment and Min Run time **at the time of commitment**
 2. hours in excess of #1 (above)
- Segment does not “carry over” to the next day
- Start-up costs (and applicable no-load costs) will be in the segment “greater of the DA Schedule or Min Run Time”

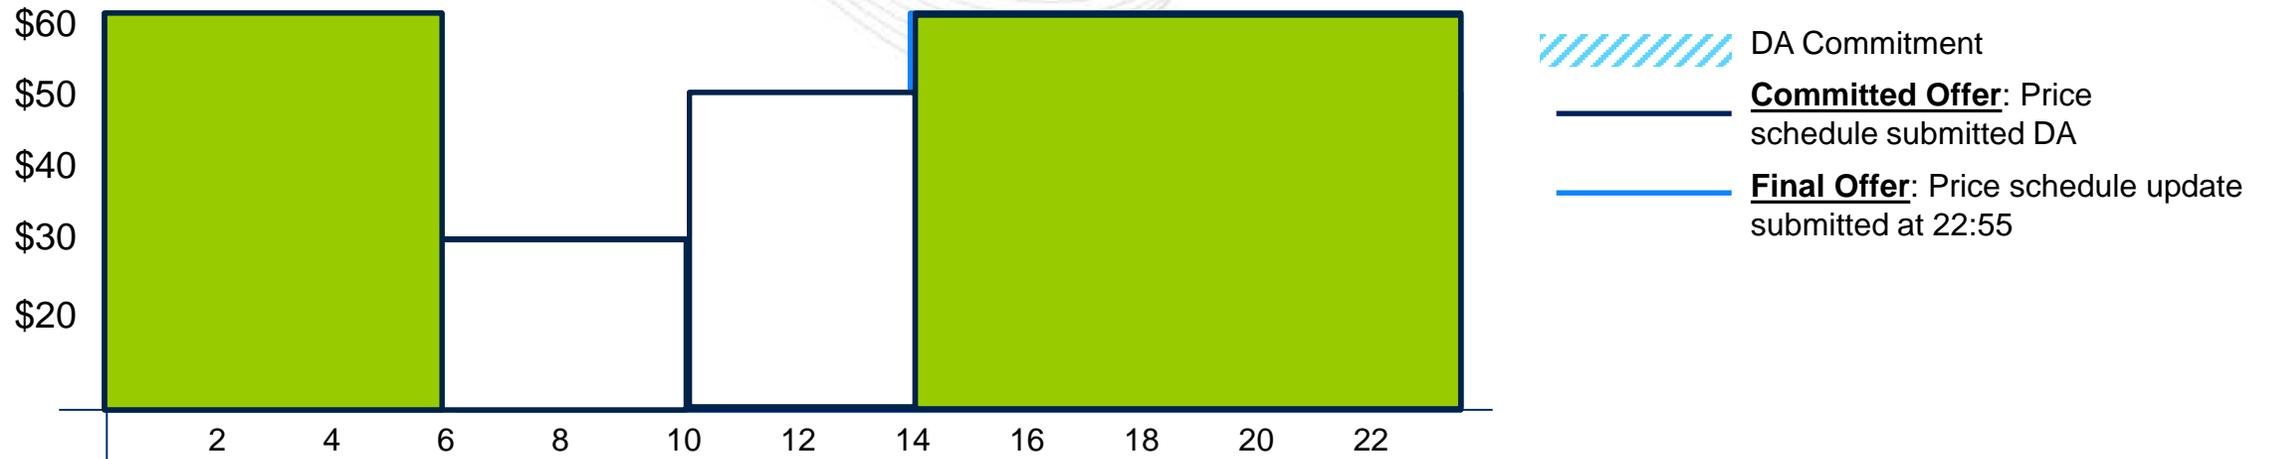

- The offer used in the Balancing Operating Reserve make-whole can vary hourly
- Pool-Scheduled Resources will be made whole in Real Time to the lesser of:
 - Committed Offer
 - Final Offer

Example 1: Committed on Price – Increase to Offer in RT

Assume cost increases for the entire day after DA market clears

Assume cost increases for the entire day after DA market clears

The offer used for the Operating Reserves Credit calculations:

Offer Used for Day-Ahead:

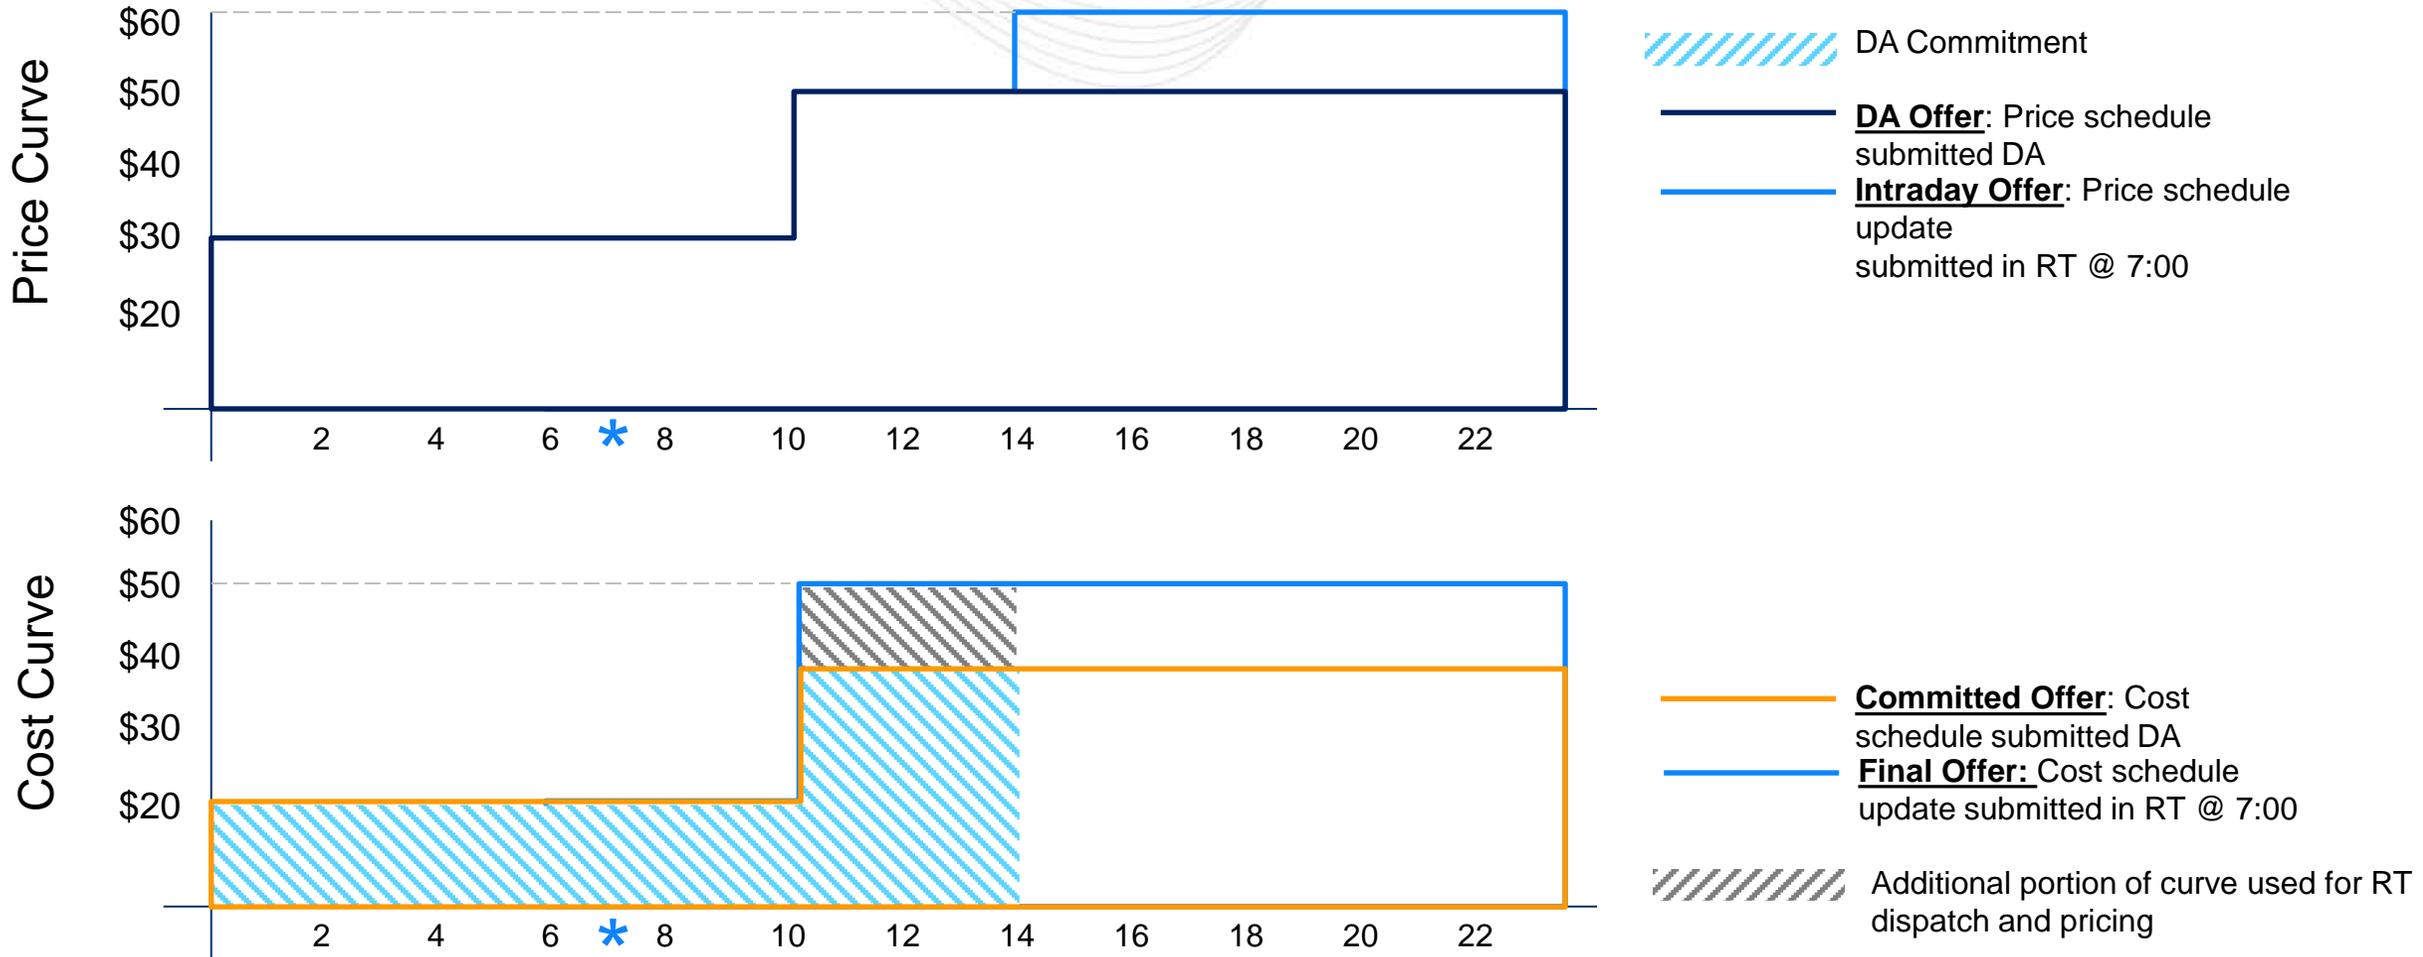

- For HB 6 – 10 the offer used is \$30
- For HB 10 – 14 the offer used is \$50

Offer Used for Balancing (If the unit is called online):

- For HB 6 - 10 the offer used is \$30 (segment 1)
- For HB 10 – 14 the offer used is \$50 (segment 1)
- If the resource was extended before HB 6 or past HB 14, then the offer used is \$60 (segment 2 excluding ramp)

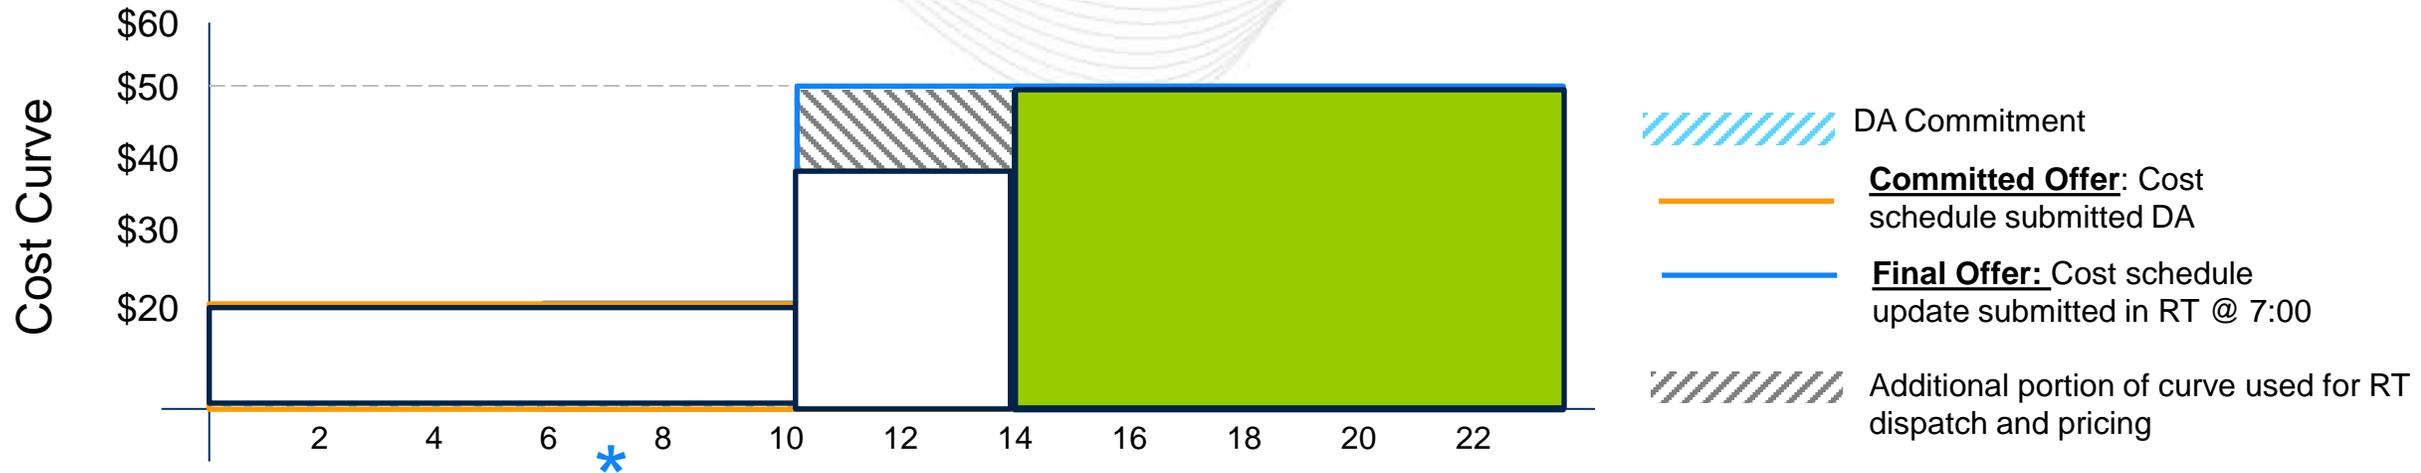

Example 2: Committed on Cost – Increase to Offer in RT

Assume cost increases for hour 10 and beyond

Example 2: Committed on Cost – Increase to Offer in RT

Assume cost increases for hour 10 and beyond

The offer used for the Operating Reserves Credit calculations:

Offer Used for Day-Ahead:

- For HB 0 – 10 the offer used is \$20
- For HB 10 – 14 the offer used is \$40

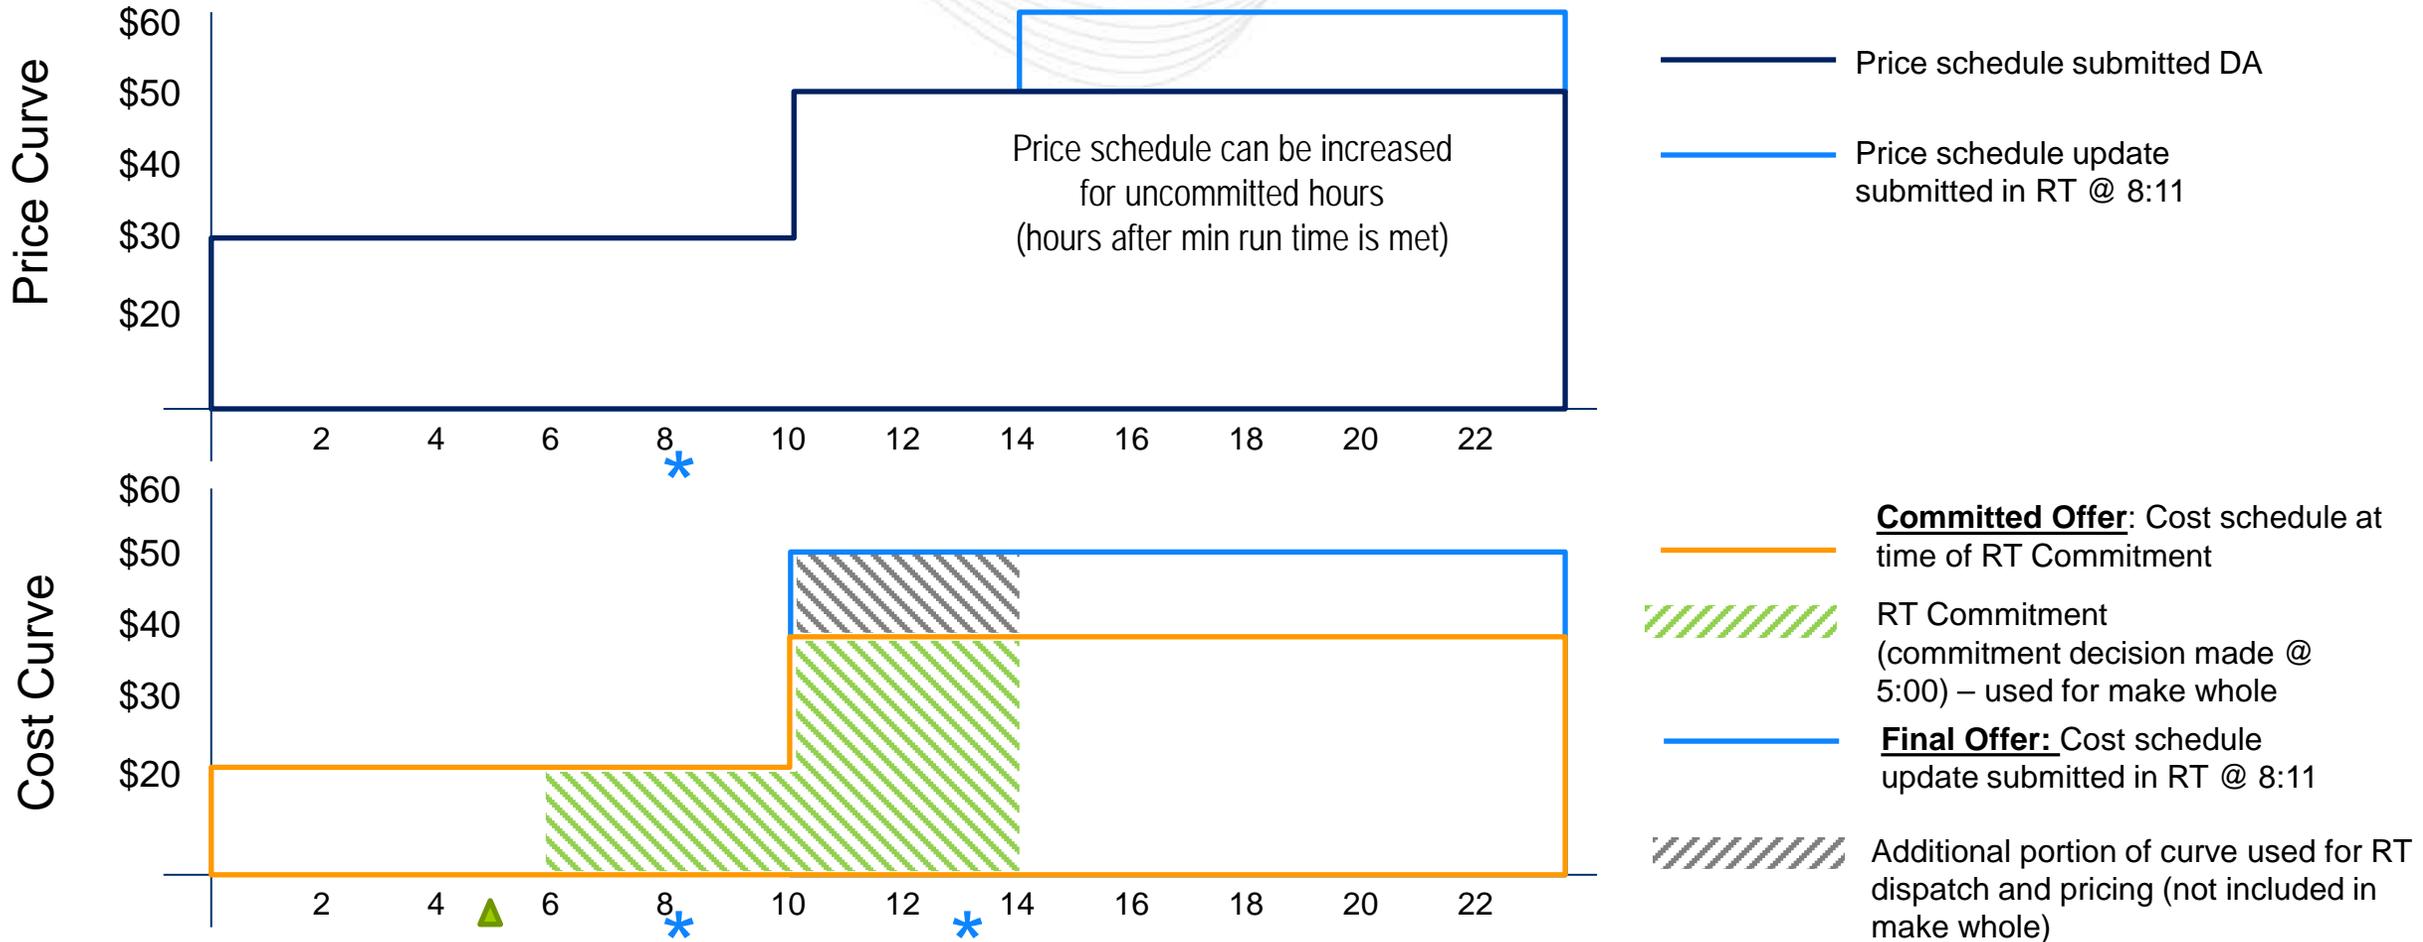

Offer Used for Balancing:

- For HB 0 – 10 the offer used is \$20 (segment 1)
- For HB 10 – 14 the offer used is \$40 (segment 1)
- If the resource was extended past HB 14, then the offer used is \$50 (segment 2)

Example 3: Committed on Cost in RT (for min run) – Increase to offer during committed and uncommitted hours

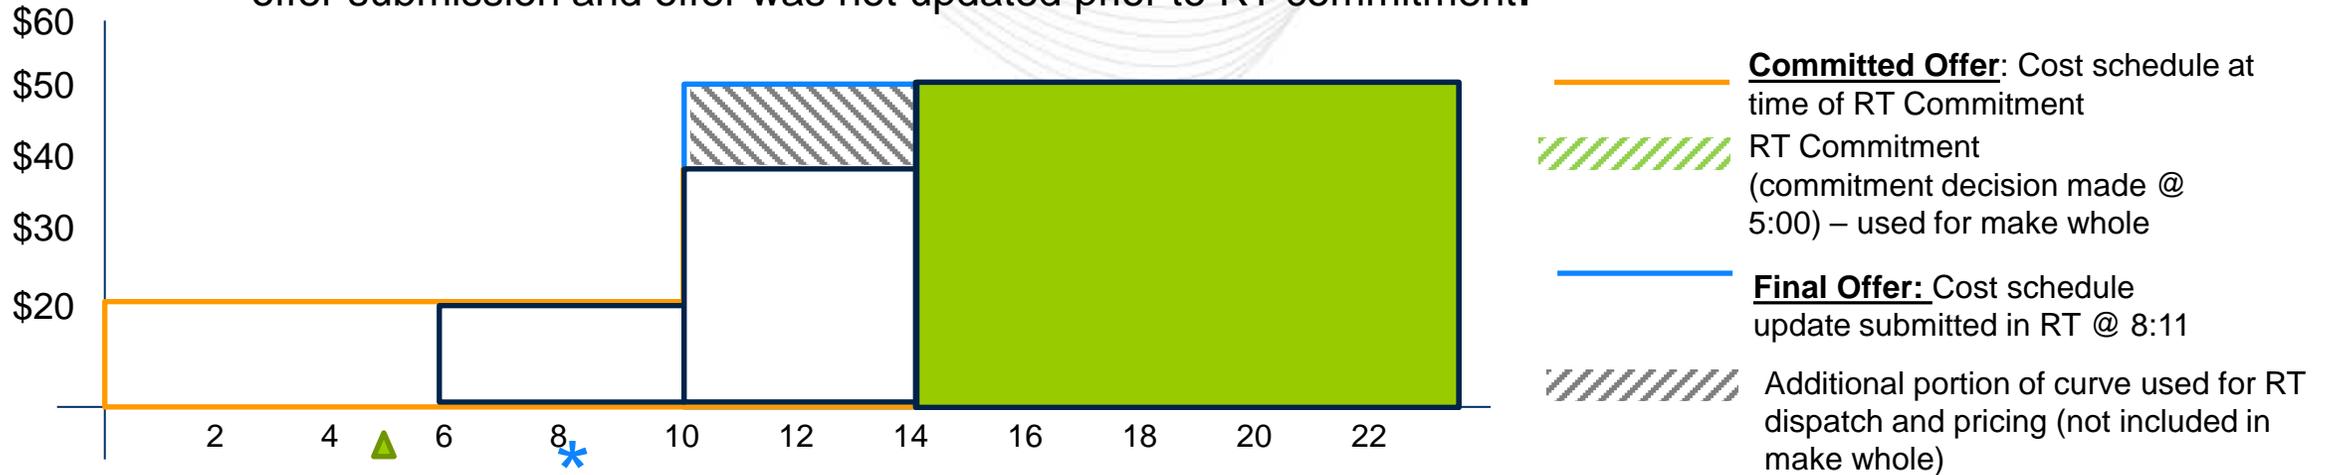

Unit has a min run time of 8 hours. Assume cost increases for hours 10 and beyond subsequent to DA offer submission and offer was not updated prior to RT commitment.

Example 3: Committed on Cost in RT (for min run) – Increase to offer during committed and uncommitted hours

Unit has a min run time of 8 hours. Assume cost increases for hours 10 and beyond subsequent to DA offer submission and offer was not updated prior to RT commitment.

The offer used for the Operating Reserves Credit calculations:

Offer Used for Day-Ahead:

- Not Committed

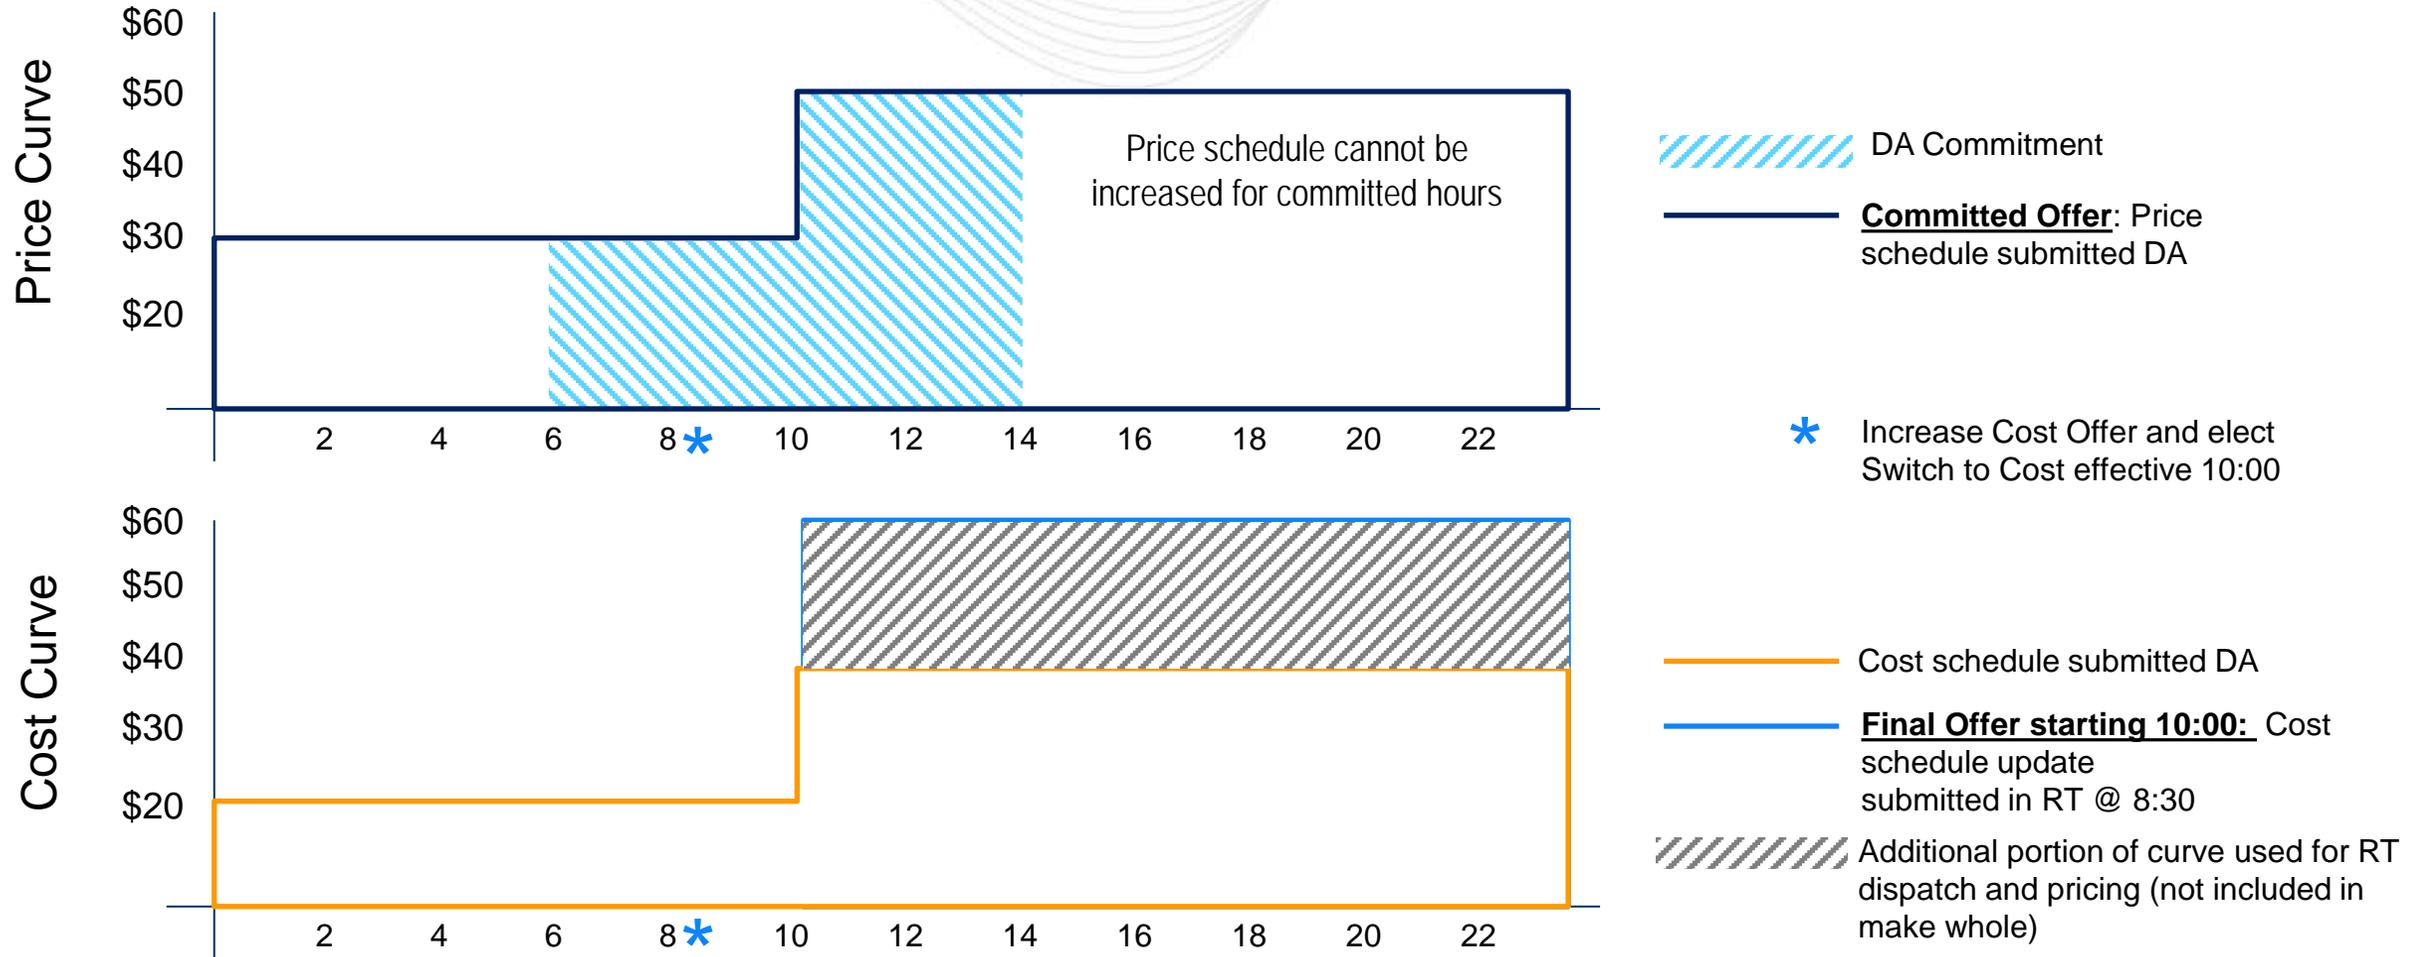

Offer Used for Balancing:

- For HB 6 - 10 the offer used is \$20 (segment 1)
- For HB 10 – 14 the offer used is \$40 (segment 1)
- If the resource was extended past HB 14, then the offer used is \$50 (segment 2)
 - In this case the Committed Offer would be the \$50 offer

Example 4: Committed on Price – Increase to Offer in RT and Elect Switch to Cost

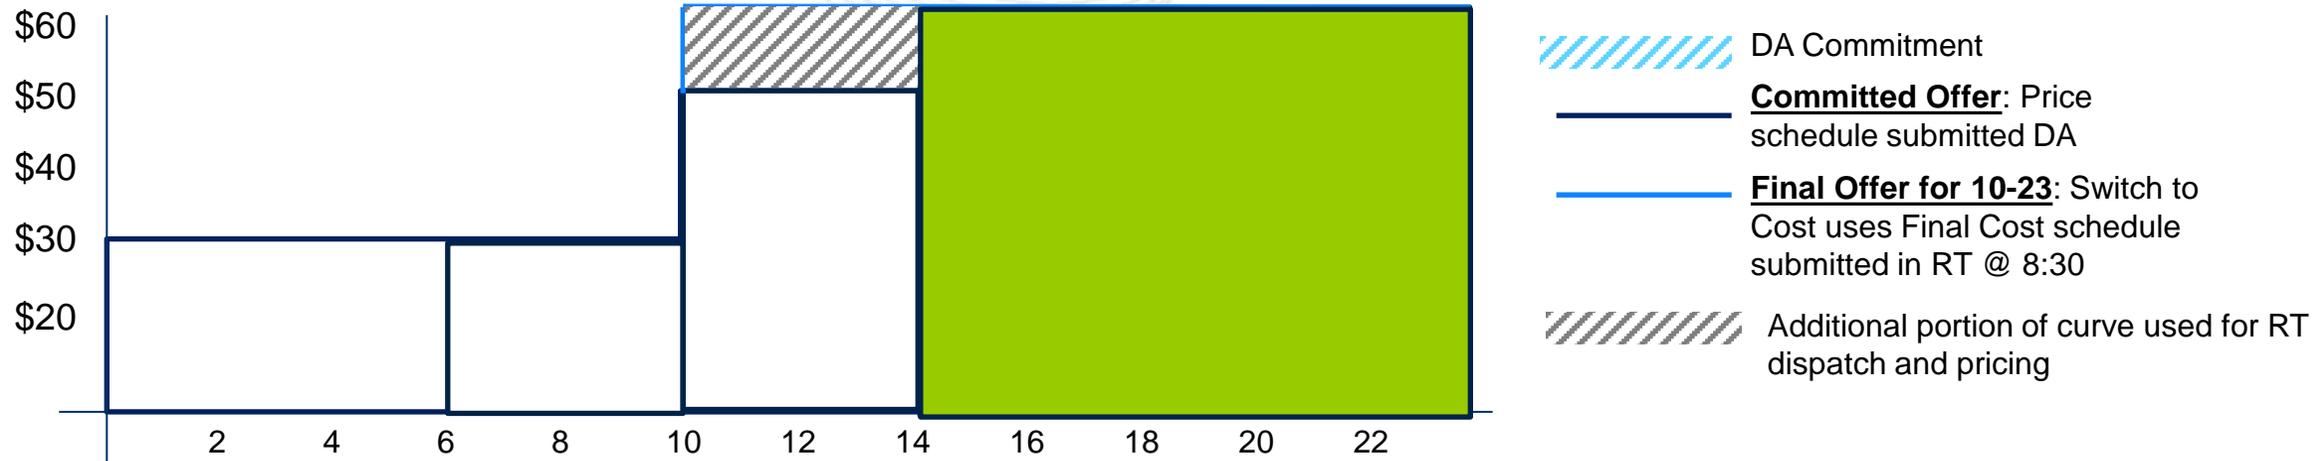

Assume cost increases starting HE 11, elect Switch to Cost at 8:30 a.m. to be effective HE 11

Example 4: Committed on Price – Increase to Offer in RT and Elect Switch to Cost

Assume cost increases for the entire day after DA market clears, elect Switch to Cost at 8:30 a.m. to be effective 10:00

The offer used for the Operating Reserves Credit calculations:

Offer Used for Day-Ahead:

- For HB 6 – 10 the offer used is \$30
- For HB 10 – 14 the offer used is \$50

Offer Used for Balancing:

- For HB 6 - 10 the offer used is \$30 (segment 1)
- For HB 10 – 14 the offer used is \$50 (segment 1)
- If the resource was extended past HB 14, then the offer used is \$60 (segment 2 excluding ramp)

- Generators whose output is reduced or suspended for reliability may be eligible for Lost Opportunity Credits
- Pool scheduled resources will be compensated using the *higher* of:
 - the Committed offer
 - the Final offer
- Self Scheduled resource compensation rules will be detailed on further slides

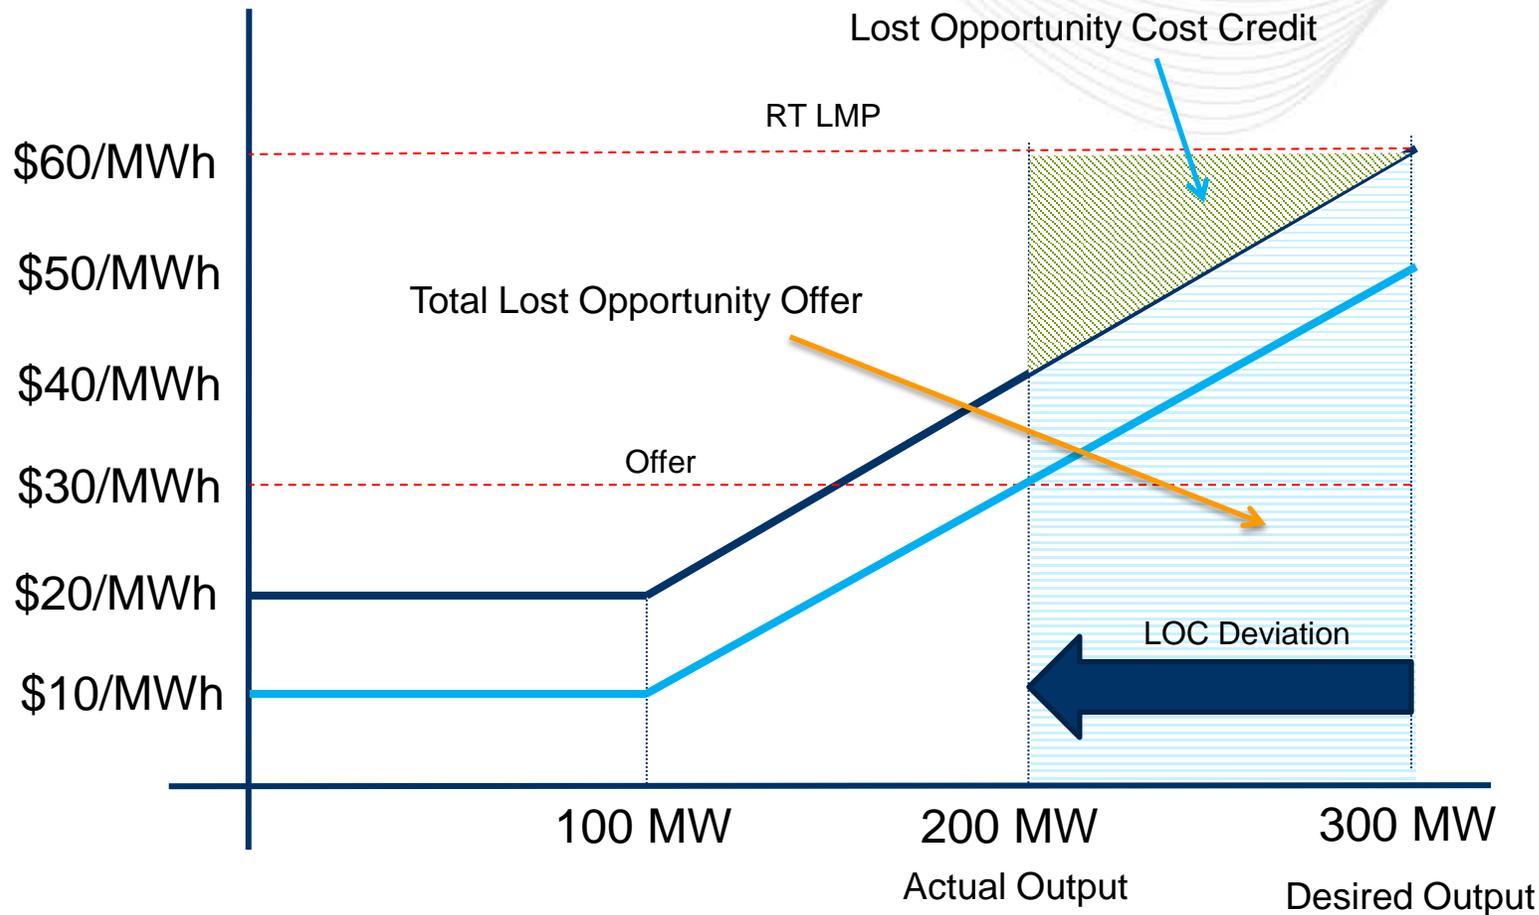

- Lost Opportunity Cost Credit
= (LOC Deviation * RT LMP) – Total Lost Opportunity Cost Offer
Where LOC Deviation =
LMP Desired Output using schedule being dispatched on
Minus
Actual Output
- Total Lost Opportunity Cost Offer =
Hourly Integrated value under the greater of Committed or Final
Offer Curve

- Self-scheduled resources committed on a:
 - Cost Schedule will be compensated using greater of Committed or Final Offer
 - Price Schedule will be compensated using greater of Committed or Final Offer unless there is an available Cost Offer that is greater than the Price Schedule

- Flexible Resources are defined as having:
 - Combined startup and notification time less than or equal to 2 hours
 - Min Run time less than or equal to 2 hours
- Flexible Resources are not eligible for LOC if the Real Time Offer is greater than the DA Committed Offer
- LOC for Resources committed DA but not operated in Real Time will be calculated using the higher of:
 - the Committed Offer
 - the last Real Time Offer submitted for the Committed Offer

Example 1: Pool Scheduled Generating Unit with Updated Offer

— **Committed Offer:** Price schedule submitted DA
— **Final Offer:** Price schedule update submitted in RT @ 7:00

EcoMax = 300 MW

EcoMin = 100 MW

RT LMP = \$60

Offer at Actual Output = \$30

Unit is mitigated in RT and backed down to 200 MW.

Applicable offer is the greater of Committed or Final Offer which in this case is the Committed Offer.

Lost Opportunity Cost Credit

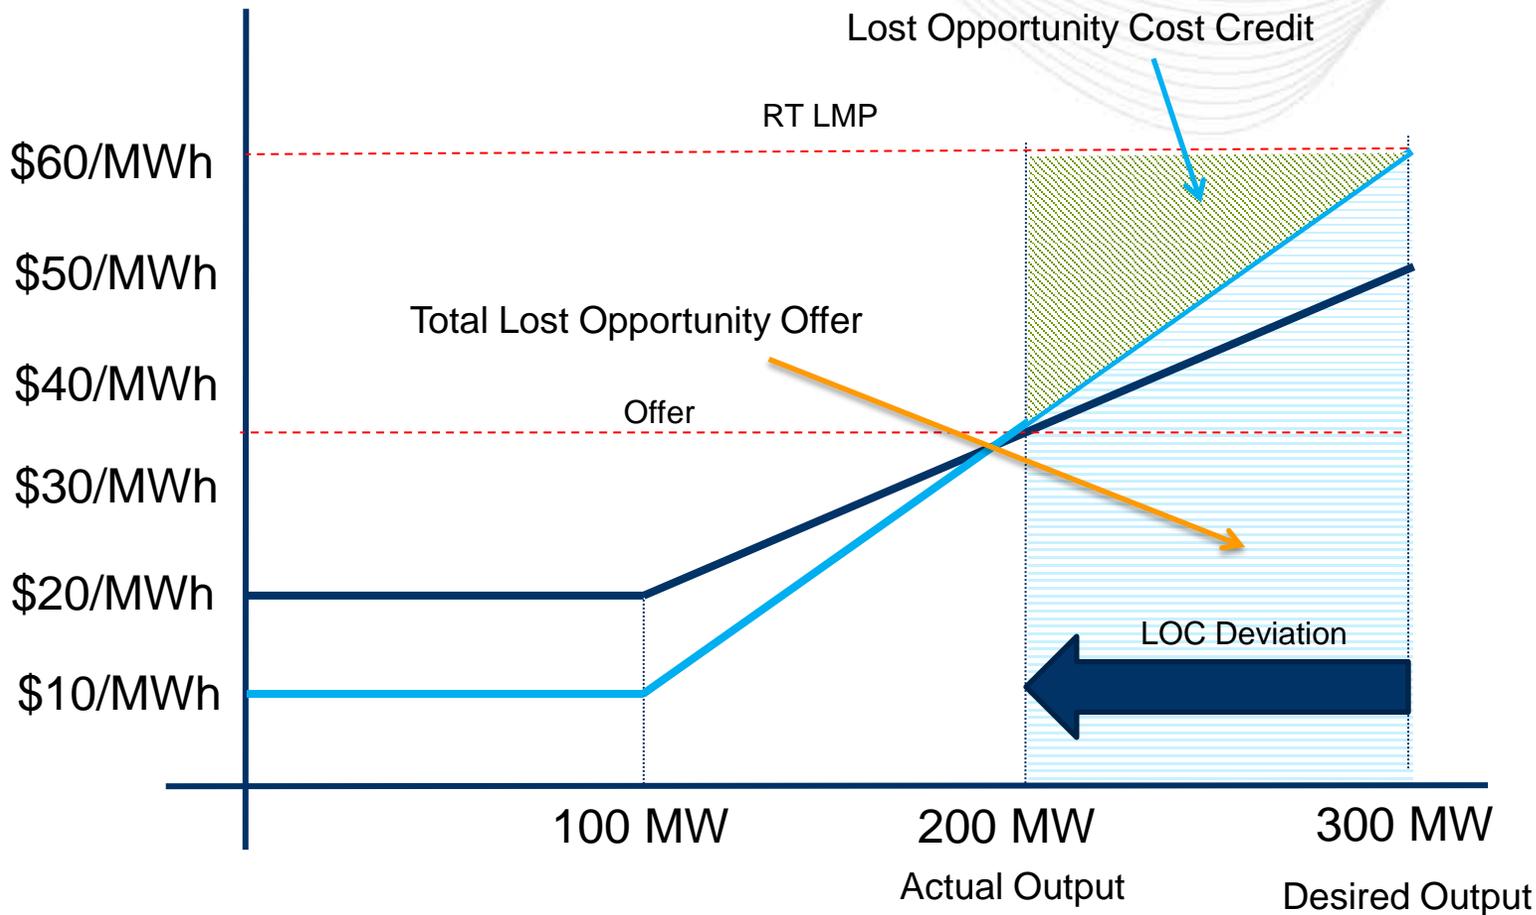

$$= (\text{LOC Deviation} * \text{RT LMP}) - \text{Total Lost Opportunity Offer}$$

$$= (100 \text{ MW} * \$60) - \$5000$$

$$= \$1000$$

Example 1a: Pool Scheduled Generating Unit with Updated Offer

— **Committed Offer:** Cost schedule submitted DA
— **Final Offer:** Cost schedule update submitted in RT @ 7:00

EcoMax = 300 MW

EcoMin = 100 MW

RT LMP = \$60

Offer at Actual Output = \$35

Unit is mitigated in RT and backed down to 200 MW.

Applicable offer is the greater of Committed or Final Offer which in this case is the Final Offer.

Lost Opportunity Cost Credit

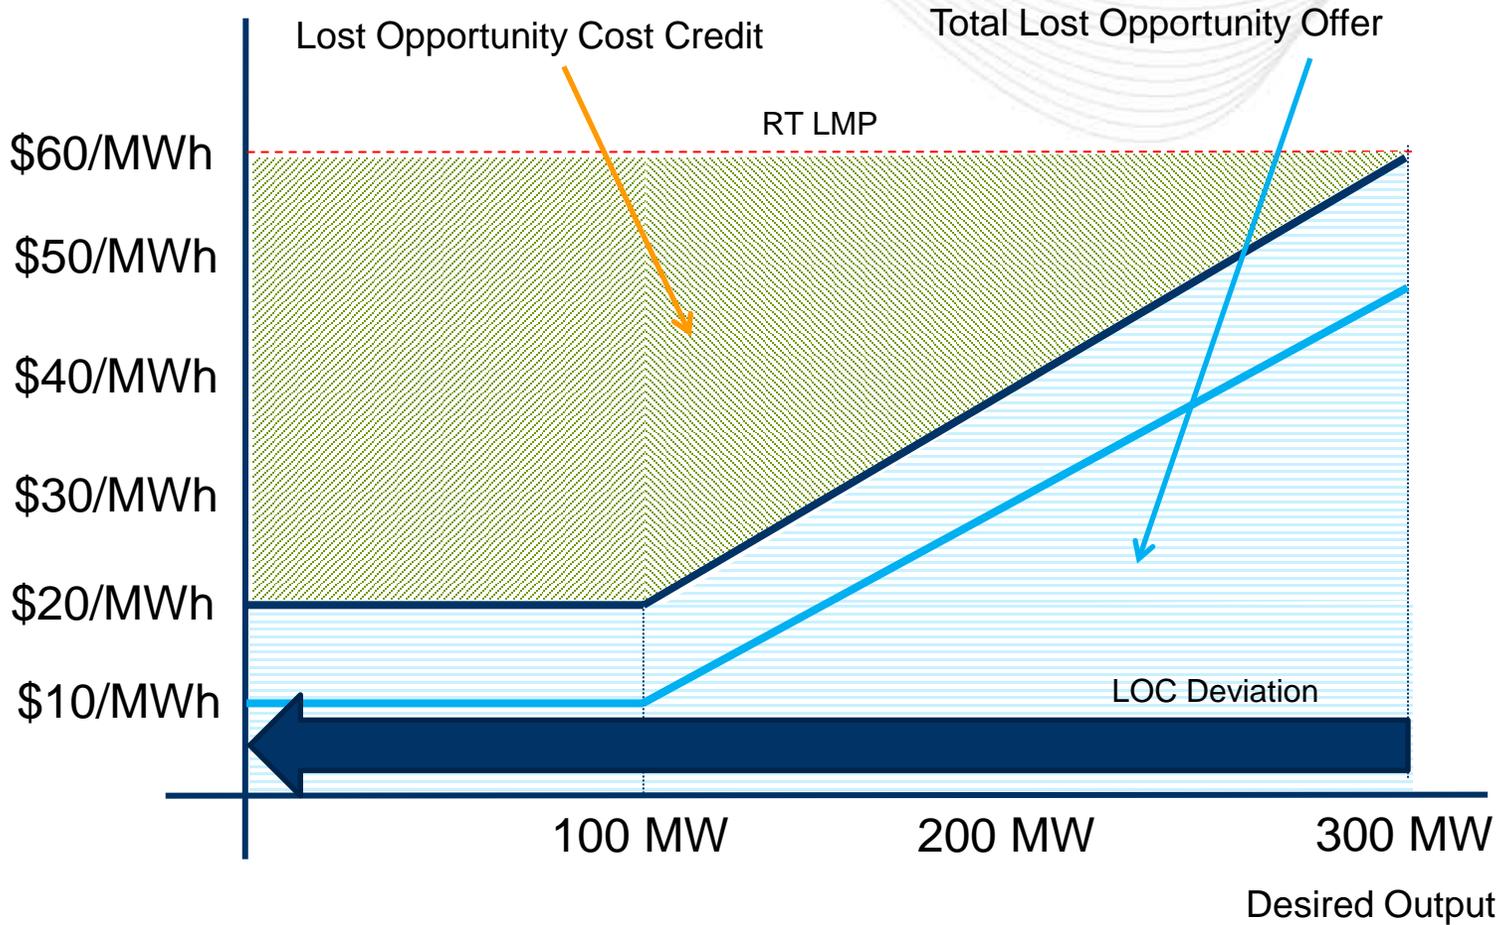

$$= (\text{LOC Deviation} * \text{RT LMP}) - \text{Total Lost Opportunity Offer}$$

$$= (100 \text{ MW} * \$60) - \$4750$$

$$= \$1250$$

Example 2: Pool Scheduled in DA Not Called in RT

— **Committed Offer:** Price schedule submitted DA
— **Final Offer:** Price schedule update submitted in RT @ 7:00

EcoMax = 300 MW

EcoMin = 100 MW

RT LMP = \$60

No-load cost = \$100

Start-up cost = \$500

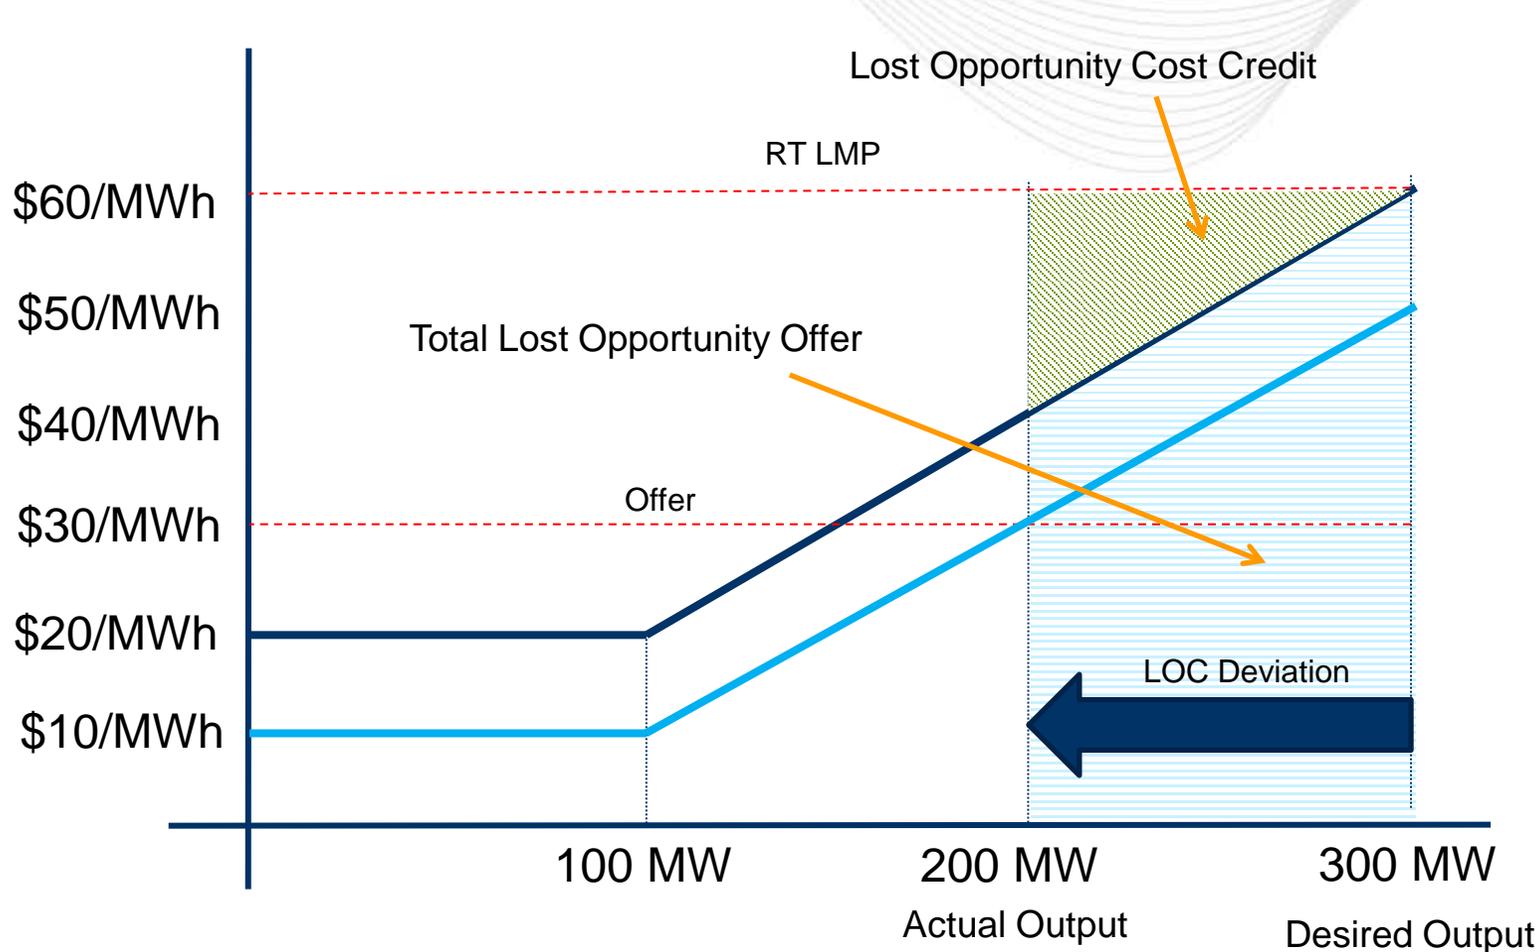

Unit is committed Day-ahead for 5 hours, but does not operate in Real Time.

Applicable offer is the greater of Committed or last Real Time Offer which in this case is the Committed Offer.

Lost Opportunity Cost Credit

$$\begin{aligned}
 &= (\text{Day-ahead MW} * \text{RT LMP}) - (\text{Total Lost Opportunity Offer} + \text{no-load} + \text{start-up}/5) \\
 &= (300 \text{ MW} * \$60) - (\$10000 + \$100 + \$100) \\
 &= \$7800
 \end{aligned}$$

Example 3: Self-Scheduled Generating Unit

— **Day-Ahead Offer:** Price schedule submitted DA
— **Real Time Offer:** Price schedule update submitted in RT @ 7:00

EcoMax = 300 MW
 EcoMin = 100 MW
 RT LMP = \$60
 Offer at Actual Output = \$30
 Unit is mitigated in RT and backed down to 200 MW.
 Applicable offer is the greater of Day-Ahead or Real Time which in this case is the Day-Ahead Offer.

Lost Opportunity Cost Credit

$$= (\text{LOC Deviation} * \text{RT LMP}) - \text{Total Lost Opportunity Offer}$$

$$= (100 \text{ MW} * \$60) - \$5000$$

$$= \$1000$$

Conclusion

- Any updates to the functionality discussed in this session will be communicated at the Tech Change Forum
- Following the completion of today's session, and the one planned for Sep. 15, the team will evaluate if additional education would be beneficial. Communication regarding anything additional will be via:
 - MIC
 - Markets Gateway User Distribution List
 - Technotify
 - Demand Response Subcommittee

- Additional Materials are available under the “Intraday Offers” section of the [Markets Gateway Tools Page](#)
 - Markets Gateway Impacts Education Slides and January 9th Recording
 - [Updated External Specification Guide](#)
 - XML Schema, including XSD information
 - Markets Gateway User Guide (intraday offer-related updates available in July)
 - [Guide to Convert Schedule IDs in Markets Gateway](#)
 - [Intraday Offers Frequently Asked Questions Document](#)
 - Accessing the Intraday Offers Markets Gateway Training Environment
 - Market Rule Changes
 - XML/Browserless Information & Examples
