Capacity Deliverability

PJM MISO Joint Stakeholder Meeting
August 24, 2012
MISO proposes a “big bang” approach to the issue of capacity coordination at the seam.

PJM believes the MISO proposed approach skips critical steps, does not provide for adequate stakeholder input, and is not realistically achievable in the proposed timeframe.

The most significant benefit to both markets with respect to capacity coordination would be achieved by resolving issues in the near term with greatest value.

PJM proposes to break the larger issue into manageable initiatives, such that each initiative can be addressed in a reasonable timeframe.
PJM Proposed Capacity Deliverability Initiatives

- Coordination and alignment of deliverability analysis of external resources (short-term)
  - External resource deliverability analysis should be comparable to that of internal resources
  - Study processes, timelines and assumptions should be aligned

- Coordination and alignment of overall capacity deliverability analyses and market timelines (mid-term)
  - Coordination of models and assumptions used in load and generation deliverability analyses
  - Coordination of market timelines

- Joint deliverability analyses and capacity markets (long-term)
  - Conduct deliverability analyses and resource adequacy procurements on a joint basis
