Curtailment Service Providers will retrieve PJM real time Energy market dispatch instructions, PJM emergency event notifications and PJM synchronized reserve event notifications on a 1 minute basis from PJM eLRS system through published Web Service standards in eLRS web service User Guide. PJM will post dispatch instructions in eLRS based on economic demand response registration or economic demand response dispatch group that has been dispatched in the real time energy market. PJM will post in eLRS emergency event notifications and instructions when it calls an emergency demand response event. PJM will post in eLRS synchronized reserve event notifications when it calls a synchronized reserve event.

CSP must maintain communication link and continuously check for dispatch instructions and event notifications and provide PJM an acknowledgment for receipt of each dispatch instruction and notification. PJM can provide generic and unsupported software client to perform the required requests and acknowledgements. This is offered as an aid for CSPs that currently do not have web service capabilities.
