

# Load Management Task Force Proposed System Changes

LMTF

March 26, 2010

- CSPs to submit hourly data for whole days (*currently only the specific hours are required*)
  - Resolve upload issues with use of interval meter data format
  - Consistent with data format used for economic CBLs
  - Provide market transparency
  - Enable PJM to perform compliance calculations
  - Designate specific date & hour to be used for test and retest (if necessary) compliance calculation. This will resolve issue of PJM trying to determine which date hour to use when multiple dates/hours loaded into system.
- CSPs to submit test notification in eLRS prior to test (*currently this is done via email and difficult to administer*)

- GLD method calculations
  - CSP to provide all data necessary to calculate
    - This will require multiple days of load data for some of the different GLD methods
      - For example, economic CBL requires at least 5 comparable days of load data.
  - PJM will do GLD method calculations except to for regression analysis or alternative economic CBLs that have not yet been automated
- Reporting
  - Improve eLRS meter data download used by CSP to review meter data that the CSP submitted.
  - Provide a report in eLRS for CSP to generate location compliance calculation details (if PJM does calculation)
  - Provide a report in eLRS for CSP to generate preliminary portfolio compliance
    - Please note this will be based on registered amounts and CSP may need to adjust based on replacement capacity transactions or difference between registered & cleared DR amount.
