

Modeling Generation Senior Task Force Report
PJM Interconnection
Members Committee Webinar
September 24, 2018

In 2016, several PJM members formed the Combined Cycle Owners User Group to work in partnership with interested and similarly situated stakeholders to discuss the design and operation of combined cycle units and their integration into the market and real-time operations of PJM. Over the course of several meetings the user group evaluated the models different RTOs/ISOs are using to model combined cycle units. At the conclusion of the education phase of the user group's work, the group came to the conclusion that a more detailed model for combined cycle units might be equally applicable to other steam units. The focus of the Modeling Generation Senior Task Force (MGSTF) is to consider expanding the model that is used in PJM's systems to improve the ability to represent the various components of all generation.

At the August 7th meeting, Stan Williams reviewed feedback provided by stakeholders regarding prioritizing solution options. The MGSTF did not meet in September. No future meeting dates have been selected at the present time. PJM staff will schedule and hold additional meetings following receipt of additional information from the vendor.

Next Meeting(s): TBD
