

Battery Dispatch Update

Detailed instructions and process steps are available in M34, Section 6

Problem / Opportunity Statement

The existing block dispatch methodology models batteries offline in the base case, but the units are available to be ramped in the generator deliverability study. Allowing the batteries to be dispatched in the RTEP base cases will increase available generation and provide better alignment with RTEP planning assumptions, state policies and queued projects part of PJM interconnection process(es).

One PJM Manual has been identified as having specific references requiring revisions:

- Manual-14B PJM Region Transmission Planning Process

The target effective date of the revised M14B Revision 59 is scheduled for April 22, 2026.
