

IMPLEMENTATION OF CONNECT AND MANAGE FRAMEWORK FOR LARGE LOAD INTERCONNECTIONS

Amendment: Reflection of Connect and Manage Loads in the Capacity Market

Issue Source

This Amended Issue Charge is presented by the Illinois Citizens Utility Board.

As discussed in the Board's January 16, 2026 Decisional Letter on the Critical Issue Fast Path – Large Load Additions (<https://www.pjm.com/-/media/DotCom/about-pjm/who-we-are/publicdisclosures/2026/20260116-pjm-board-letter-re-results-of-the-cifp-process-large-load-additions.pdf>), the PJM Board of Managers has directed PJM to implement a “Connect and Manage” framework for new large load additions that do not Bring Your Own New Generation (BYONG) with curtailment expected to occur prior to the deployment of pre-emergency Demand Response, subject to stakeholder development of the appropriate operational framework. The framework is meant to serve as an interim solution to manage the reliability challenges during the transition period in which new load additions are outpacing the additions of new capacity in the PJM system. The framework will apply to the Electric Distribution Companies (EDCs) or Transmission Owners (TOs) serving new large loads. It would apply specifically to the EDCs or TOs where these certain loads are not linked with qualifying Bring Your Own New generation (BYONG) or other supply resource arrangements (to be defined in the stakeholder process) for Delivery Years where there is a shortage of available capacity to satisfy the Installed Reserve Margin (IRM).

The NRDC/PJM Legislators Collaborative Solution Package and the Joint Consumer Advocates Solution Package in the Critical Issue Fast Path – Large Load Additions detailed that PJM would only procure supply for large loads to the extent that new qualified, deliverable capacity has been added to support them, and zones that have added large loads without supporting capacity will receive interruptible service in proportion to the zonal shortfall. In other words, according to these Packages, the RPM demand curve would only include large load additions that are supported by incremental new capacity, and zones that do not have sufficient capacity should not be included in the demand curve and will be subject to Connect and Manage. This Senior Task Force will include an evaluation of the appropriate treatment of large loads as part of the RPM demand curves.

Issue Content

The Board's January 16th letter:

Where an LSE identifies a shortfall between forecasted load additions and the availability of new incremental generation to offset that growth, the Board is directing development of a similar framework articulated by the PJM Legislators Collaborative/NRDC and the Joint Consumer Advocates. Under this framework, the incremental demand associated with such load growth would be subject to curtailment prior to the deployment of pre-emergency Demand Response. This will help to preserve Demand Response as a valuable reliability tool by not disrupting its business model through a dramatic increase in its use and will provide an incentive for new load to secure capacity or provide flexibility.

Issue Charge

Consistent with its operation of the system today, PJM will take all reasonable steps to maintain grid stability and avoid curtailment. However, should system conditions over a given period force PJM to invoke its emergency procedures, the Board finds it reasonable for certain large loads, including data centers, to move to their backup generators, or curtail their demand, for a limited number of hours during the year to prevent a larger scale outage for residential and other consumers. Such curtailment would be expected to occur infrequently, for limited durations, and only when necessary to prevent broader system impacts, consistent with PJM's longstanding operational practice of avoiding curtailment whenever possible.

Ultimately, the determination of which loads are curtailed during emergency conditions rests with TOs, and with LSEs that have direct relationships with their customers. PJM does not have authority to direct individual retail loads to curtail demand. However, PJM will establish an allocation framework whereby TOs and LSEs have advanced notification of the potential magnitude of load reductions that may be required under such conditions. PJM intends to explore how to design curtailment allocations based on the contributions of any shortfall to PJM's required reserve margin.

~~The Board does not propose that "connect and manage" new large load be removed from the capacity market. Based on current load projections, the system is expected to tighten to a degree that excluding this demand would be unlikely to reduce capacity prices below point "A" on the Variable Resource Requirement (VRR) curve. Removing such load from the market would instead result in large new loads avoiding capacity costs altogether, with those costs shifted to existing consumers. The capacity market is designed to support system-wide resource adequacy, recognizing that PJM may be required to direct load curtailments to maintain system reliability, with TOs ultimately determining which customers to curtail."~~

Additionally, this Senior Task Force shall consider a framework for market rule changes that only include new Large Load Additions in the RPM demand curve once qualified, deliverable new capacity is recognized, on an incremental basis. **The evaluation will not consider changes to the treatment, at the wholesale level, of retail customers existing and taking electric service before the 2026/27 BRA that may otherwise qualify as large loads, unless a state has specifically placed an existing retail customer into an analogous connect-and-manage scheme.**

Key Work Activities and Scope

As directed in the Board letter, the scope is defined as addressing the following items:

1. **Education:** Education on legal topics including state and federal jurisdiction, and implicated processes and procedures that exist today (including the Large Load Addition process and its inclusion in the Base Residual Auction (BRA), and existing reporting requirements for LSEs to identify new generating capacity additions to offset Large Load Additions). ~~Education on existing reporting requirements for LSEs to identify new generating capacity additions to offset Large Load Additions, and on the impact of large load forecasts on past and future BRA clearing results.~~
2. **Scoping Load:** Discuss and develop the process to determine the ~~new~~ Large Loads ~~Additions~~ that will be subject to the connect and manage framework. ~~Discuss and develop a process to determine which, if any, Large Loads will be included in RPM demand curves. This process will not include retail customers existing and taking electric service before the 2026/27 BRA, unless a state has specifically placed an existing retail customer into an analogous connect-and-manage scheme.~~

3. **Scoping Supply:** Discuss and develop what qualifying BYONG or other supply resource arrangements (and their related terms and conditions) would be acceptable to offset the quantity of load subject to Connect and Manage across EDCs/TOs. Discuss and develop criteria for new supply supporting Large Loads, including through BYONG, to be included in RPM demand curves. This process will not include retail customers existing and taking electric service before the 2026/27 BRA, unless a state has specifically placed an existing retail customer into an analogous connect-and-manage scheme.
4. **Demand Curve Criteria:** Discuss and develop any changes to how RPM Demand Curves are developed with regard to Large Loads. This process will not include retail customers existing and taking electric service before the 2026/27 BRA, unless a state has specifically placed an existing retail customer into an analogous connect-and-manage scheme.
5. **Assessing processes, procedures, and potential need for governing document enhancements:** Discuss and develop processes, procedures and the potential need for governing document enhancements to, among other things:
 - . Define supply-load linkages for the purposes of Connect and Manage exemption and incorporation into RPM demand curves.
 - . track supply-load linkages for purposes of determining how PJM, the PJM states, LSEs, and/or Transmission Owners will perform their respective roles under the connect and manage framework and for inclusion in the RPM demand curve; and
 - . allow PJM, the PJM states, LSEs, and/or Transmission Owners to evaluate on a Delivery Year basis new large loads additions that are not linked with qualifying BYONG or other supply arrangements.
6. **Capacity shortfall allocation methodology and transparency:** Discuss and develop methodology used to allocate capacity shortfalls associated with new Large Loads for a given Delivery Year (DY), as a function of applicable large loads additions and applicable qualifying BYONG or other supply resource arrangements paired with new Large Loads Additions, in each Delivery Year. Discuss and develop methodology used to allocate capacity shortfalls associated with new Large Loads for a given Delivery Year (DY) to the EDC/TOs, as a function of applicable large load additions and applicable qualifying BYONG or other supply resource arrangements paired with new Large Loads Additions, in each Delivery Year. Also, discuss and develop mechanisms to promote transparency into the MW quantities identified for potential curtailment by the EDC/TO and the broader PJM stakeholder community. This could include, by way of example only, communications in advance of the Delivery Year and in the operations horizon as appropriate and subject to Confidentiality and CEII restrictions. This process will not include retail customers existing and taking electric service before the 2026/27 BRA, unless a state has specifically placed an existing retail customer into an analogous connect-and-manage scheme.
7. Evaluate and define the system conditions, reliability triggers, and operational sequencing under which load subject to the Connect and Manage framework would be curtailed, including consideration of alternative trigger points relative to existing emergency procedures and pre-emergency Demand Response.

- 8. Develop the framework for curtailment:** This includes a new emergency procedure, including the applicable conditions and sequencing of curtailment actions, and their relationship to pre-emergency Demand Response and other emergency procedures, that PJM would use to issue a curtailment instruction to the EDC/TO for their implementation, including the applicable conditions under which the procedure could be implemented, relationship to other emergency procedures, and other relevant details. The framework development will also consider any associated automations, telemetry and/or market outcome reforms, such as price formation during curtailments. This procedure is expected to be an interim measure that will only be necessary during the transition Delivery Years until new supply can sufficiently match the increasing load.

As instructed by the Board letter, the following items are considered out of scope:

- ~~1. Changes to the demand included in the capacity market.~~
2. Changes to PJM's authority or role in the determination of which specific retail load/customers a TO/LSE will curtail when receiving an instruction from PJM to shed load
3. Changes to the overall load shed allocation approach across the RTO. It is intended that this work be handled as a follow-on stakeholder effort.

Expected Deliverables

1. Education on the matters identified above in key work activities section of this Issue Charge.
2. Development of reporting requirements for LSEs to identify new generating capacity additions to offset new Large Load Additions prior to inclusion in the Demand Curve for a given delivery year. **This process will not include retail customers existing and taking electric service before the 2026/27 BRA, unless a state has specifically placed an existing retail customer into an analogous connect-and-manage scheme.**
3. Proposed solutions that address the key work activities/in scope matters identified in this Issue Charge.
4. Corresponding revisions to the PJM Tariff or other governing documents consistent with the solution proposed will be brought to the MRC and MC for review and endorsement. Proposed revisions to PJM Manuals conforming to the FERC accepted solution will be brought to the appropriate Standing Committees for review and endorsement.

Decision-Making Method

Tier 1, consensus (unanimity) on a single proposal

Stakeholder Group Assignment

Connect and Manage Senior Task Force reporting to the MRC

Expected Duration of Work Timeline

Provide an estimate of the length of time expected to resolve the issue and complete its course through the stakeholder process. Include the expected start date, the issue's priority level and timing (e.g. "immediate start") and the frequency of meetings required. Please also identify any known deadlines or key milestone dates that stakeholders should be aware.
