Electric Storage Participation
Straw Proposal

Laura Walter
Sr. Lead Economist
PJM Advanced Analytics Department
Market Implementation Committee
October 10, 2018
Timeline

- February, 2018: FERC final rule on storage …
  - Filing due Dec 3, 2018.
  - Implementation due Dec 3, 2019.

Electric Storage Resource (ESR) = “a resource capable of receiving electric energy from the grid and storing it for later injection of electric energy back to the grid.”

- Connected at: transmission, distribution, or behind a customer meter.
  - PJM has ESR at both T and D today, none behind a meter that inject.
- Excludes demand response.
- Includes pumped hydro

Over 5,300 MW of Electric Storage Resources currently in PJM

- Pumped Hydro: 96%
- Other Storage: 4%

**Data taken from Generation Queue and EIA 860**
1. Can sell* energy, **Capacity**, and A/S (incl. Black Start etc.) the resource is technically capable of providing

2. Dispatched and **sets price** as seller and buyer

3. Bid parameters that account for ESR characteristics

4. Min market threshold is 100 kW

5. Stored MWh are billed at LMP as wholesale

* “Eligible to provide…”
Participation Model

- ESRs will be modeled as one continuous resource
- PJM will not make commitment decisions in the ESR model and not manage state of charge
  - Start and no load cost will not be considered
- 3 modes of operation:
  - Continuous, Charge & Discharge
- Parameters
  - Offered in through Markets Gateway
    - Max/Min charge/discharge, etc
    - Ramp considered infinite only in continuous mode

Continuous operation mode - ESRs can update their max charge and discharge limits hourly in day-ahead and more frequently in real-time.

** State of charge telemetry will be requested for telemetered resources
Charge and Discharge Mode

Charge & Discharge mode will be available to ESR resources in DA and RT
ESR resources can manage their own state of charge through the different modes and updates to limits, as well as hourly price offers in DA. Self-schedule will be available for ESRs.
Synchronized Reserves

- Synchronized Reserve Amounts will need to be offered in and updated in RT.
- ESRs will opt-in for synchronized reserves
- Possible to offer synchronized reserve without energy offer (Similar to regulation)

www.pjm.com
In all modes, the amount of response provided during an event will determine compensation.
PJM proposes that status quo, per manual 21, of a minimum of 10 hour duration is maintained in the capacity market.
• DA must offer for capacity storage
  – Status quo: The hourly Day-ahead self-scheduled values for intermittent resources and Capacity Storage Resources may vary hour to hour from the capacity obligation value.
• Criteria for using ESR model
  – FERC definition – “a resource capable of receiving electric energy from the grid and storing it for later injection of electric energy back to the grid.”

• Make whole adjustments
  – Eligible for make whole during manual dispatch
