PJM Rules Regarding the Siting of New Load Behind the Meter of an Existing Generation Resource

Action Required	Deadline	Who May Be Affected
<p>Review FAQ document for rules and requirements</p> 	<p>--</p> 	<p>Generation Owners Seeking to Site New Load behind the Meter of Existing Generation</p> 

- Various generation owners have recently sought guidance on PJM rules regarding the siting of new load directly behind the meter of an existing generator
- The proposed arrangements contemplate the new host load as being directly and, in most cases, exclusively served by the existing generator
- PJM rules regarding such arrangements have been posted in the form of an FAQ document on the RPM section of the PJM website at:

<https://www.pjm.com/-/media/markets-ops/rpm/rpm-auction-info/pjm-rules-on-siting-new-load-behind-the-meter-of-existing-generation.ashx>

The FAQ document provides answers to the following questions:

1. What rules apply to a generator owner that seeks to directly and exclusively serve host load located behind the generator's meter?
2. Is a generation owner required to notify PJM and the interconnected TO of the owner's intention to establish new host load?
3. Are there any new agreements that must be executed?
4. Will existing agreements require modification?
5. Is the capacity value of the generation resource affected by the addition of the new host load?

6. Can a generation owner avoid this de-rate of the generation resource's capacity value by committing to curtail the new host load during PJM emergency conditions?
7. The new host load is to be normally served by a single specific generating unit at the facility, however, when this unit is out-of-service due to planned, maintenance or forced outage then a second generating unit at the facility will be used to serve the host load. How should this arrangement be handled from an outage scheduling and reporting perspective?
8. Are there additional modeling or metering requirements for the host load addition?
