Motivation

Reliability Pricing Model

PJM identifies

“the essential elements of the capacity market are:

- procurement of capacity three years before it is needed through a competitive auction;
- locational pricing for capacity that varies to reflect limitations on the transmission system and to account for the differing needs for capacity in various areas of PJM; and
- a variable resource requirement curve, which is the energy demand formula used to set the price paid to market participants for capacity”

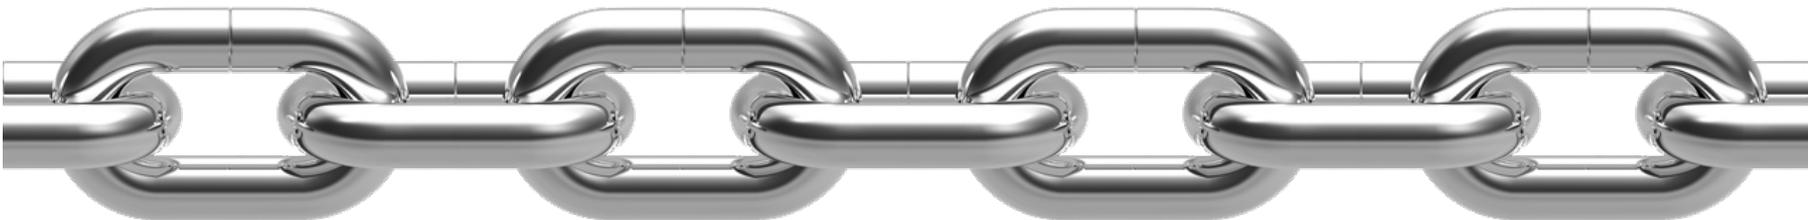

<http://learn.pjm.com/three-priorities/buying-and-selling-energy/capacity-markets.aspx>

Reliability Pricing Model

More simply stated – the tenets of the market are:

- Competitive
- Reliability driven
- Price signal that varies based on the reliability level

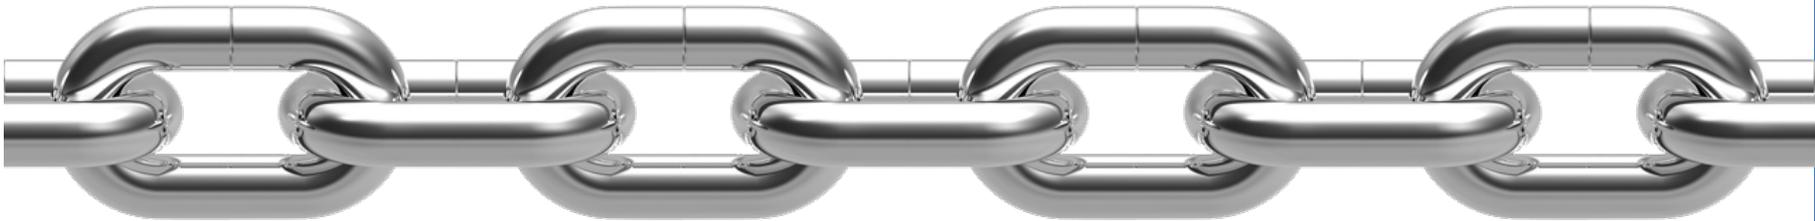

Core Links Must Be Maintained

Competitive Markets

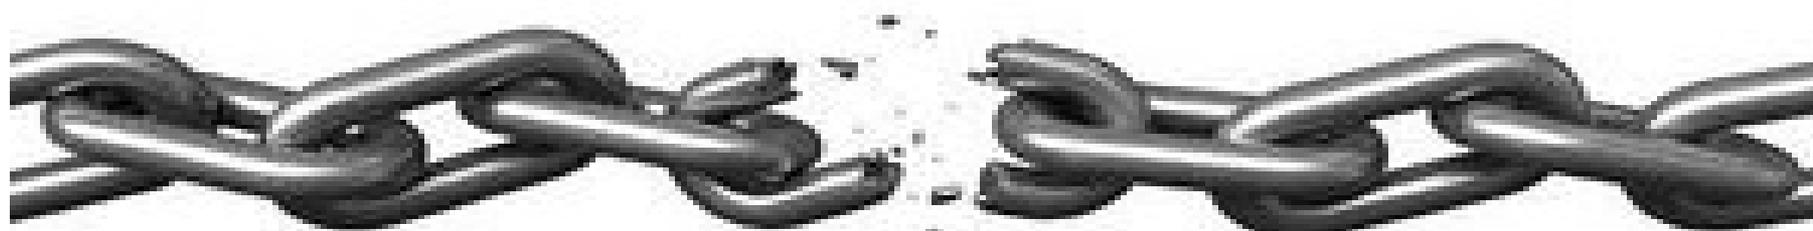

For a competitive bidding process to work properly, there needs to be tension between a supplier's desire to

- Clear the capacity market, and
- Establish a high clearing price

Core Links Must Be Maintained

Motivation

**De-linking the RPM Core Tenets Through
Two-Stage Repricing Puts the Competitive
Process At Risk**

Two-stage approaches explicitly de-link:

- Supply offers that set the capacity obligation

Figure 1. First Stage of Auction, Cleared Capacity Determined

- Different supply offers that set price

Figure 2. Second Stage of Auction, Capacity Price Determined

Two-stage approaches explicitly de-link:

- Supply offers that set the capacity obligation

- Different supply offers that set price

Figure 1. First Stage of Auction, Cleared Capacity Determined

Figure 2. Second Stage of Auction, Capacity Price Determined

Flaws with two-stage de-linking and reference pricing:

- Removes the tension between the offer made and the likelihood of clearing for some resources
- Encourages subsidies for generation owners with a long position – offer whatever and clear
- Creates a race-to-the-bottom for resources without subsidies – just get me some \$\$\$
- Removes connection between reserve levels and clearing prices in the reference price zone

Flaws with two-stage de-linking:

- Removes the tension between the offer made and the likelihood of clearing for some resources
- Encourages subsidies for generation owners with a long position – offer whatever and clear
- Creates a race-to-the-bottom for resources without subsidies – just get me some \$\$\$
- Removes connection between reserve levels and clearing prices in the reference price zone

Flaws with two-stage de-linking:

- Reference price levels not consistent with competitive offer price levels
- Fundamental change to the Reliability Pricing Model – not an accommodative approach
- Increases cost to load without associated reliability benefit – overshoots stated goal

Flaws with two-stage de-linking:

- 
- Reference price levels not consistent with competitive offer price levels
 - Fundamental change to the Reliability Pricing Model – not an accommodative approach
 - Increases cost to load without associated reliability benefit – overshoots stated goal

Price Signal Based on the Reliability Level

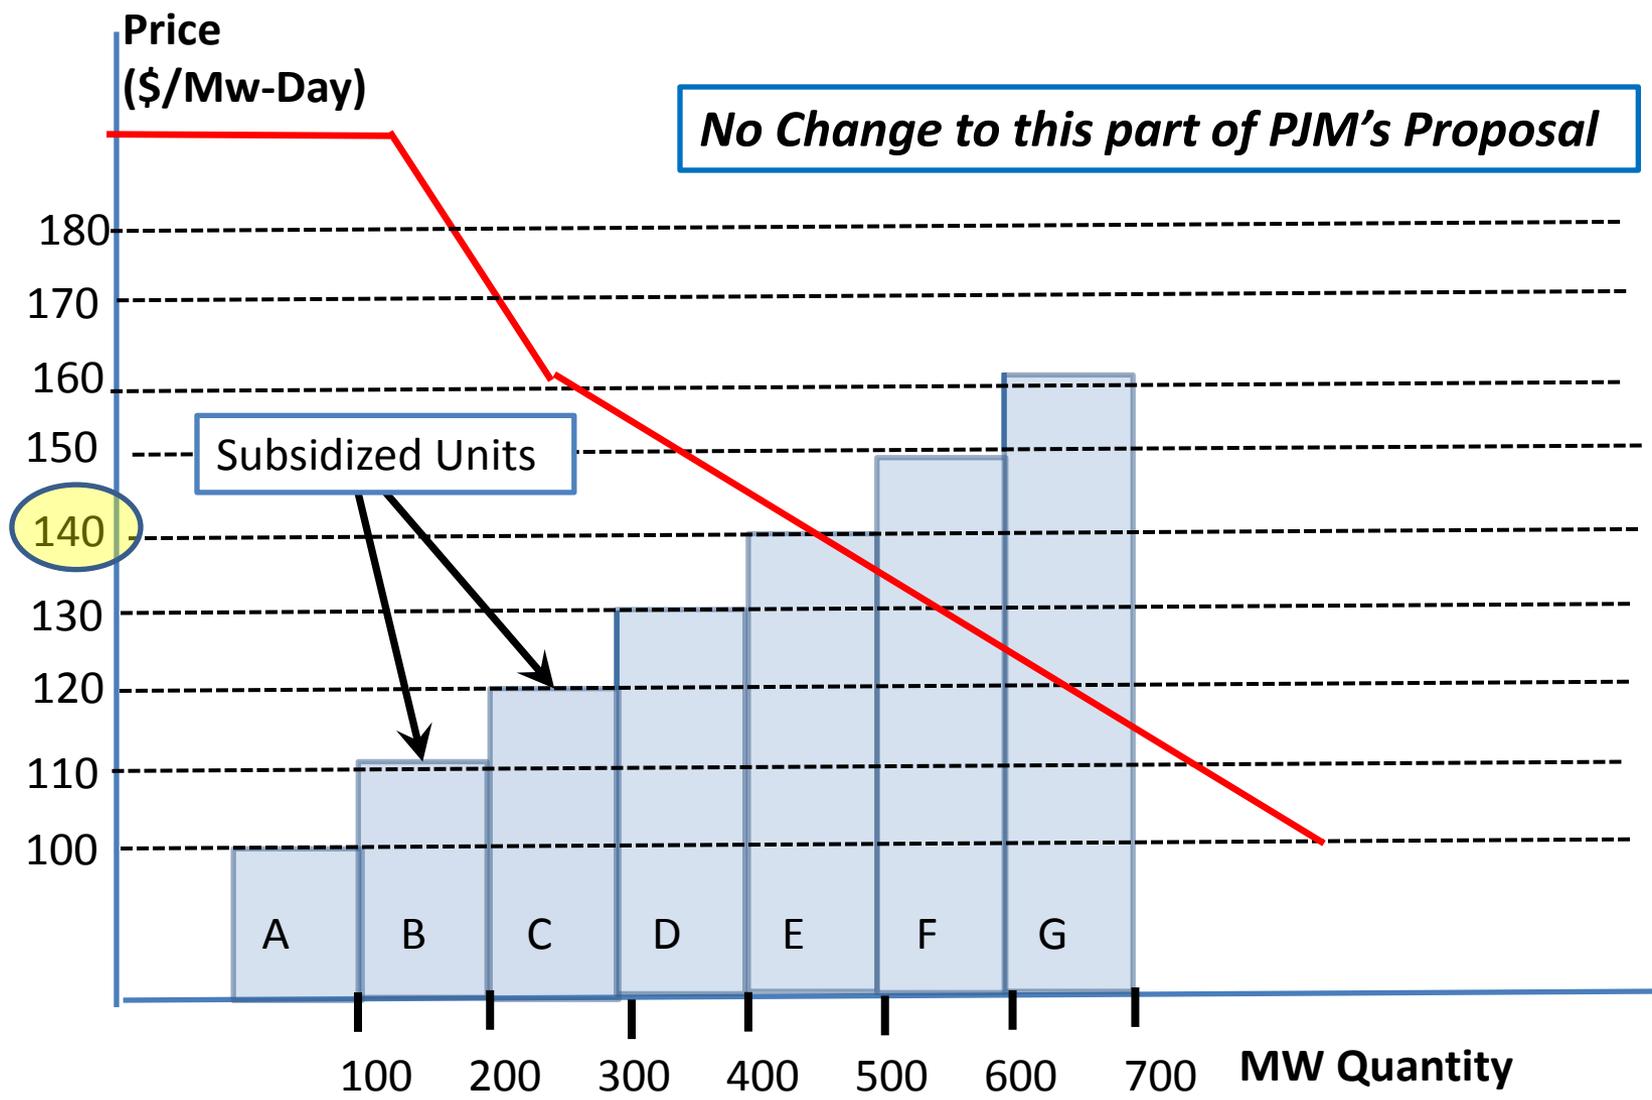

Proposal

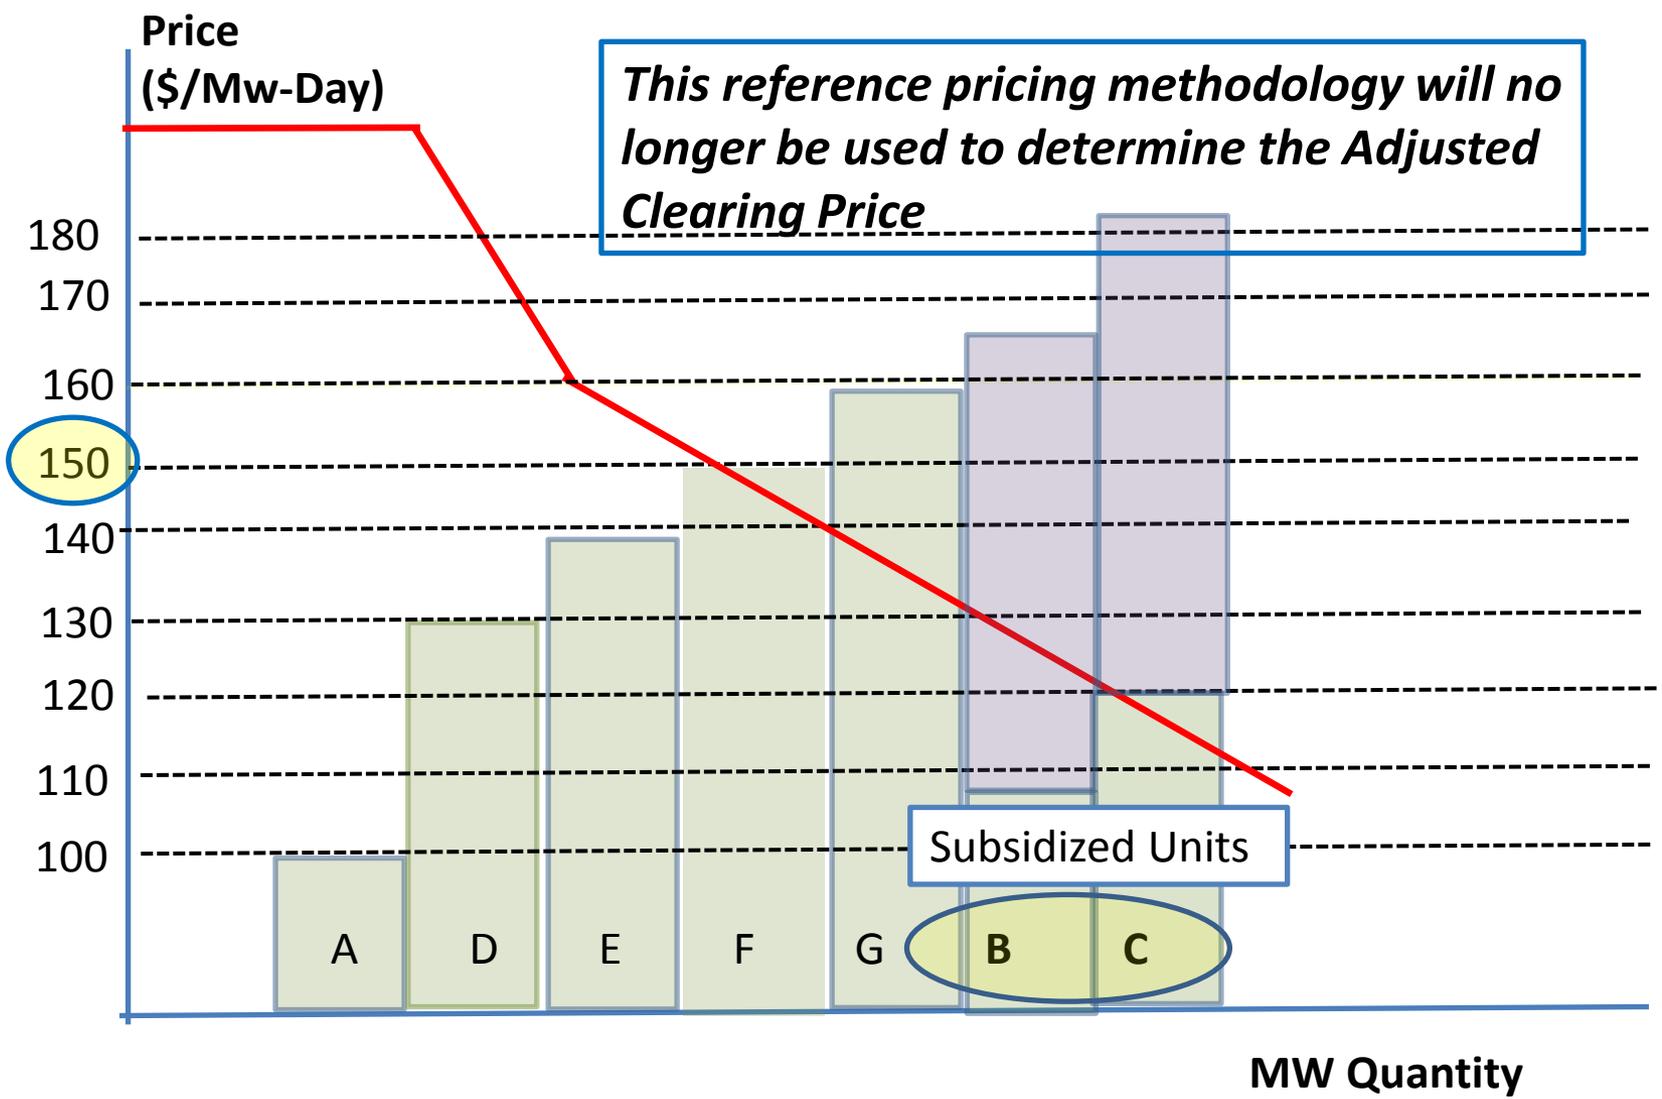

ODEC Proposal

- Reduces the de-linkage of PJM's two-stage proposal
- Replaces offers from subsidized resources with the competitive offers in the market

PJM "Stage 1" – Determination of Cleared Offers

PJM's Existing Stage 2 Methodology

“Stage 2” Reconfigured Supply Curve Offers

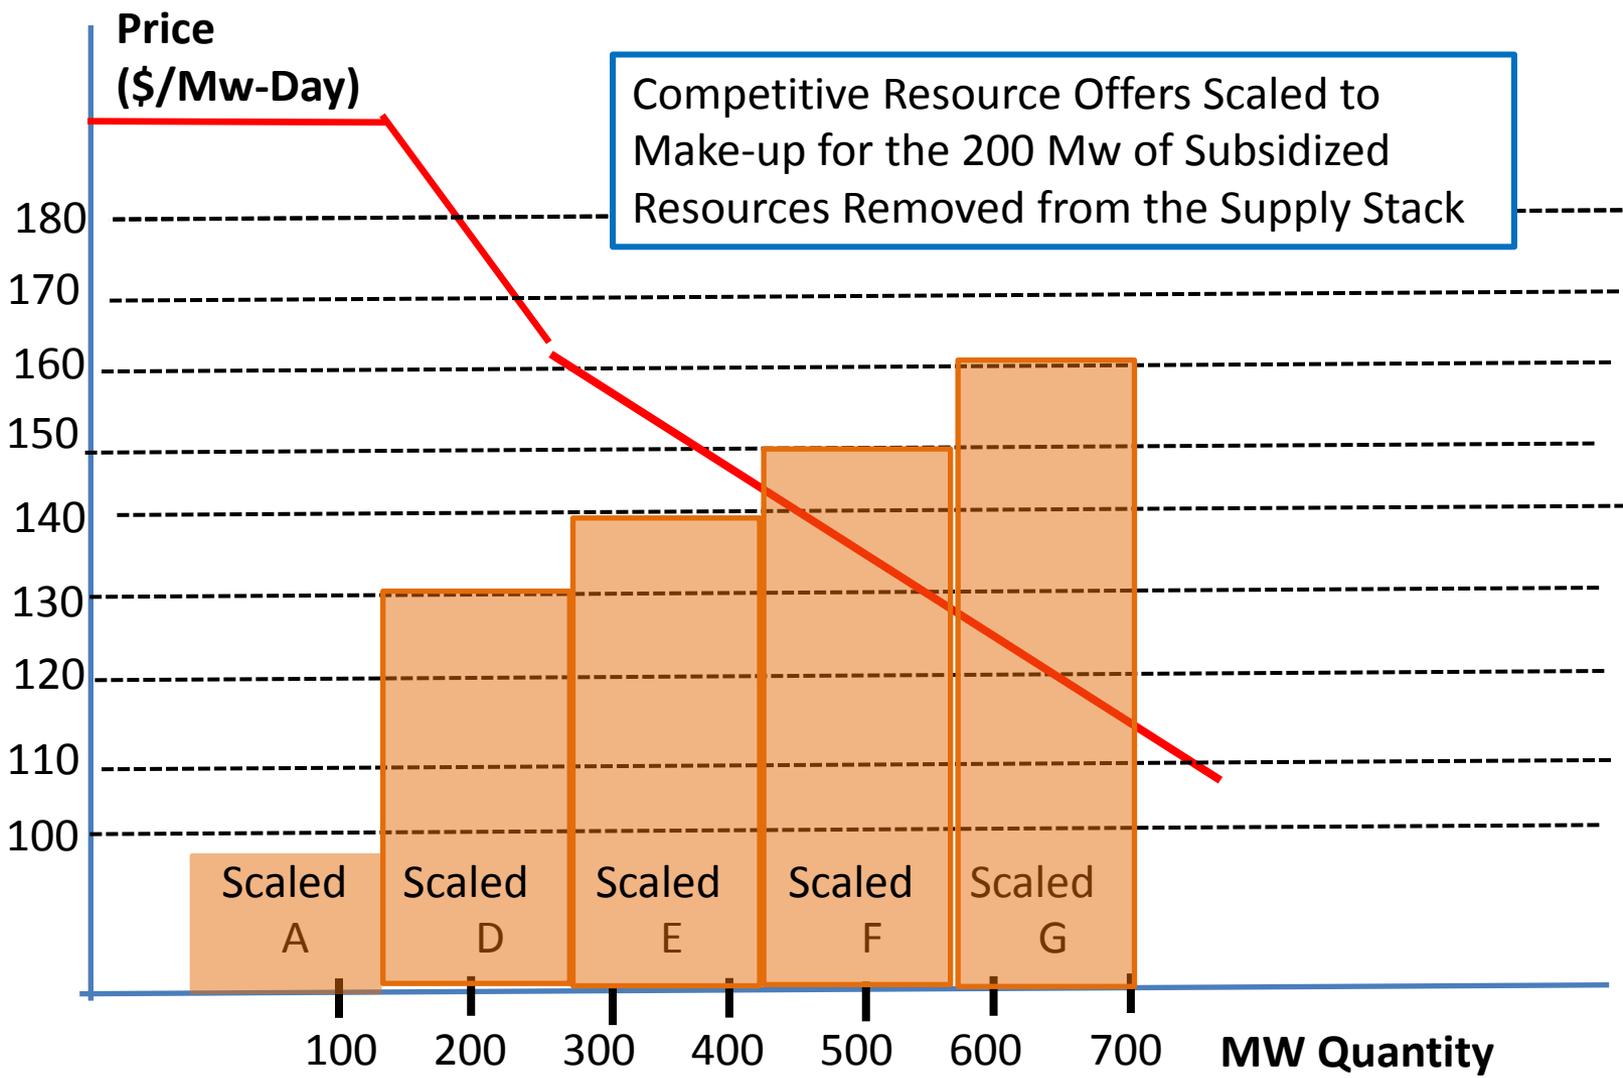

Proposal

For Stage 2 process, existing competitive supply offers are scaled to reflect the amount of subsidized offers that are removed from the supply curve.

Original Offer Stack				Reconfigured Offers	
Resource	Size (MW)	Offer Price (\$/MW-day)	Subsidized	Size (MW)	Offer Price (\$/MW-day)
A	100	100	No	140	100
B	100	110	Yes		
C	100	120	Yes		
D	100	130	No	140	130
E	100	140	No	140	140
F	100	150	No	140	150
G	100	160	No	140	160
Total	700			700	

$$\text{Extrapolation \%} = \frac{\text{Subsidized Resource (Mws)}}{\text{Competitive Resources (Mws)}} = \frac{200}{500} = 40\%$$

Proposed Methodology for Stage 2 Repricing

PJM's Questions

- How do you define the problem that you are trying to solve with your proposal?
 - Goal of the ODEC proposal is to improve stage 2 in PJM's repricing proposal. Replaces Net CONE times B with the competitive supply stack.
- Does your proposal accommodate resources with state government preferences on a non-discriminatory basis? How?
 - Yes, with a two-stage repricing approach.
- Will your proposal encourage or frustrate state policy objectives or other subsidies?
 - No.
- What is your definition of an actionable subsidy (you may include specific factors such as MW or economic thresholds, timing of payment, rate and reasons for the subsidy, etc.)?
 - Currently the same as PJM's. Might adjust to that from Jim Wilson's September 2017 presentation at CCPSTF.
- What impact does your proposal have on energy markets?
 - Not able to predict but don't expect a large impact, if any.
- Will your proposal result in or mitigate long term price suppression in the capacity market and/or the energy market?
 - Not sure that long-term price suppression is to be expected without the proposal.

- How do you think your proposal will impact bidding behavior?
 - Expect bidding behavior to remain competitive.
- Please address the effects of your proposal on potential market manipulation.
 - Do not expect market manipulation.
- Please address the potential for “leakage” (the effects of one jurisdiction’s actions on other jurisdictions).
 - The clearing price might rise for RPM.
- What is the preferred implementation timing?
 - No preference.
- For repricing proposals, please explain your treatment for “in between” resources and why you believe it is the right approach (“in between” resources are those that did not clear in one stage of a repricing proposal but offered at a level less than the final clearing price determined in a second stage).
 - This is a fundamental concern, to various degree, with all the two stage repricing proposals. As such, ODEC believes the single stage clearing mechanism remains the preferred option.
- How does your proposal address RPS, RGGI, ZEC and REC programs?
 - Same as PJM right now.
