

Day-Ahead Energy Market

PJM State & Member Training Dept.

Objectives

Students will be able to:

- Identify the process and procedures for participating in the Day-Ahead Market

eMKT Intro

Uses of eMKT

PJM eMKT is the system that PJM Market Participants use to participate in the Day-Ahead Energy Market, Synchronized Reserve Market and Regulation Market. Market Participants can use PJM eMKT to prepare and submit:

- Generation offers
- Regulation offers
- Synchronized reserve offers
- Demand bids
- Increment offers and decrement bids
- Load response bids

Uses of eMKT

- Enter bilateral regulation transactions
- Enter bilateral synchronized reserve transactions
- Review public and private Day-Ahead Energy market results
- Review public and private Ancillary Services Market results

Interfacing with eMKT

- **Web-based Interactions** — access is provided through a series of web-based interactive displays, which are accessible through the internet
- **XML-formatted File Exchange** — input and output files that are posted or downloaded, using the market user interface (MUI) or another participant-created application

PJM Day-Ahead Market

Capacity Resource Requirements

- Generation Capacity Resources shall submit a schedule of availability for the next seven days and may submit non-binding offer prices for the days beyond the next Operating Day
- The set of offer data last submitted for each Generation Capacity Resource shall remain in effect for each day until specifically superseded by subsequent offers

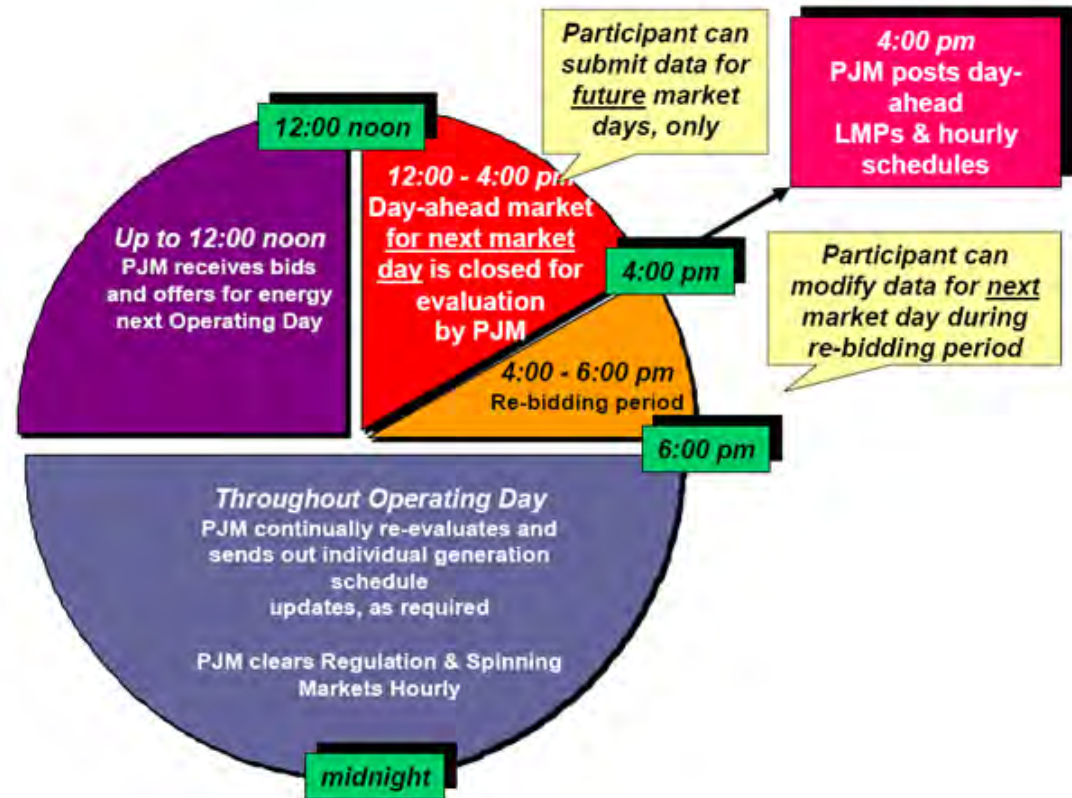

Capacity Resource Requirements

- Any generator that is a PJM generation capacity resource that has an RPM Resource Commitment must submit a bid schedule into the Day-ahead Market even if it is self-scheduled or unavailable due to outage

PJM eMKT Timeline

All Energy offers need to respect the Day-Ahead market clearing timelines:

- 1) Offers entered by 12 Noon
- 2) From 12 Noon to 4PM, PJM runs the DA market for the next operating day
- 3) At 4PM, PJM posts the resources that cleared the DA market, along with DA LMPs

Updating Generation Data When the Market is Closed

- When the Market is closed, you **cannot** update the generator Unit and Schedule data

Exception

- When the Market is closed, you **can**:
 1. Make Unit Hourly Updates for:
 - a) Current day – operating hour and beyond
 - b) Two days in the future through 6 days in the future

The DA Market is closed from 12 Noon through 4PM, and 6PM through 12AM

Cost-based Start Costs for Price-based Units

- Price-based units choosing price-based start-up and no-load costs can only change them twice per year
- Price-based units have the option to submit cost-based start-up and no-load costs on a daily basis
- Must stay as cost-based start-up and no-load costs for the entire 6-month period
- Choice between using cost-based or price-based start up and no-load fees can be made twice a year

Cost-based Start Costs for Price-based Units

- Open Enrollment Window:

Period	Period Covers:	Submit By:
1	April 1 st to September 30 th	1200 Hours March 31 st
2	October 1 st to March 31 st	1200 Hours September 30 th

Enrollment exceptions:

- Initial request to switch to market-based offers
- New generating resource

Use Startup and No-load Switch (Price Based Units)

- The Operating Company determines whether PJM should use the startup and no load information for a price-based unit. This is accomplished by marking the Use Startup No Load switch available and unavailable on the Schedule Detail web page
- The Operating Company indicates on the Unit Detail webpage if a priced-based unit's startup cost is price-based or cost-based
- The Use Startup No Load switch can be set each day
 - Yes — PJM should use the Startup and no-load information for the selected schedule
 - No — PJM should not use the Startup and no-load data elements

Generator Operating Parameters

- Each generator has different characteristics that it submits to PJM along with their energy bid
- These variables can be cost-based, time-based, or a physical parameter:
 - **Cost variables:** Start-up cost, no-load cost
 - **Time variables:** Notification time, start-up time, min-run time, min-down time
 - **Physical parameters:** Min and Max, ramp rate

Unit Parameters

- Generators can be Cost-based or Price-based:
 - Determined for each new unit or new unit ownership
 - Cost (per Cost Development Guidelines)
 - Price (per participants offer strategy)
 - **A Generation Capacity Resource offer may not exceed \$1000/MWh**
 - Under normal conditions
 - FERC granted temporary waiver during time of extreme gas prices

Start Cost

- **Start costs** Startup cost (or price) is associated with the cost to supply steam to operate the turbine and bring the generating unit to synchronous speed. There are three states for Startup costs (or prices):

- Hot
- Intermediate
- Cold

Start Cost is the dollars per start as determined from start fuel, total fuel-related cost, performance factor, electrical costs, start maintenance adder, and additional labor cost

Temperature State Definitions

The following information can be changed on the Schedule Detail page:

Cold and Intermediate state definitions

The amount of time in hours, after shutdown that a hot temperature state unit takes to cool down to a cold or intermediate temperature state

- **Hot to Cold Time**
- **Hot to Inter Time**

Hot to Cold Time \geq Hot to Inter Time

Notification and Startup Times

The following information can be changed on the Schedule Detail page:

Notification Times

The time interval in hours, between PJM notification and the start sequence of a generating unit that is currently in one of three temperature states

- **Hot Notification Time**
- **Inter Notification Time**
- **Cold Notification Time**

Startup Times

The time interval, measured in hours, from the actual unit start sequence to the breaker close for a generating unit in one of the three temperature states

- **Hot Startup Time**
- **Inter Startup Time**
- **Cold Startup Time**

Start Costs for Price-based Units

1. Price-based units choosing price-based start-up and no-load costs can only change them twice per year effective for two six month periods
 - Entered on Unit Detail page
2. Price-based units have the option to submit cost-based start-up and no-load costs on a daily basis
 - Entered on Schedule Detail page
 - Must stay as cost-based start-up and no-load costs for the entire 6-month period
 - Choice between using cost-based or price-based start up and no-load fees can be made twice a year

No-Load Cost

- No-load cost (or price) is the hourly fixed cost (or price), expressed in \$/hr, to run the generating unit at zero net output
 - Needed to create the starting point of a monotonically increasing incremental cost curve

Use Start Costs

3. The generation owner determines whether PJM should use the startup and no load information for their unit (price-based or cost-based) on a daily basis. This is accomplished by marking the Use Startup No Load switch available and unavailable on the **Schedule Detail** web page

Operational Limits

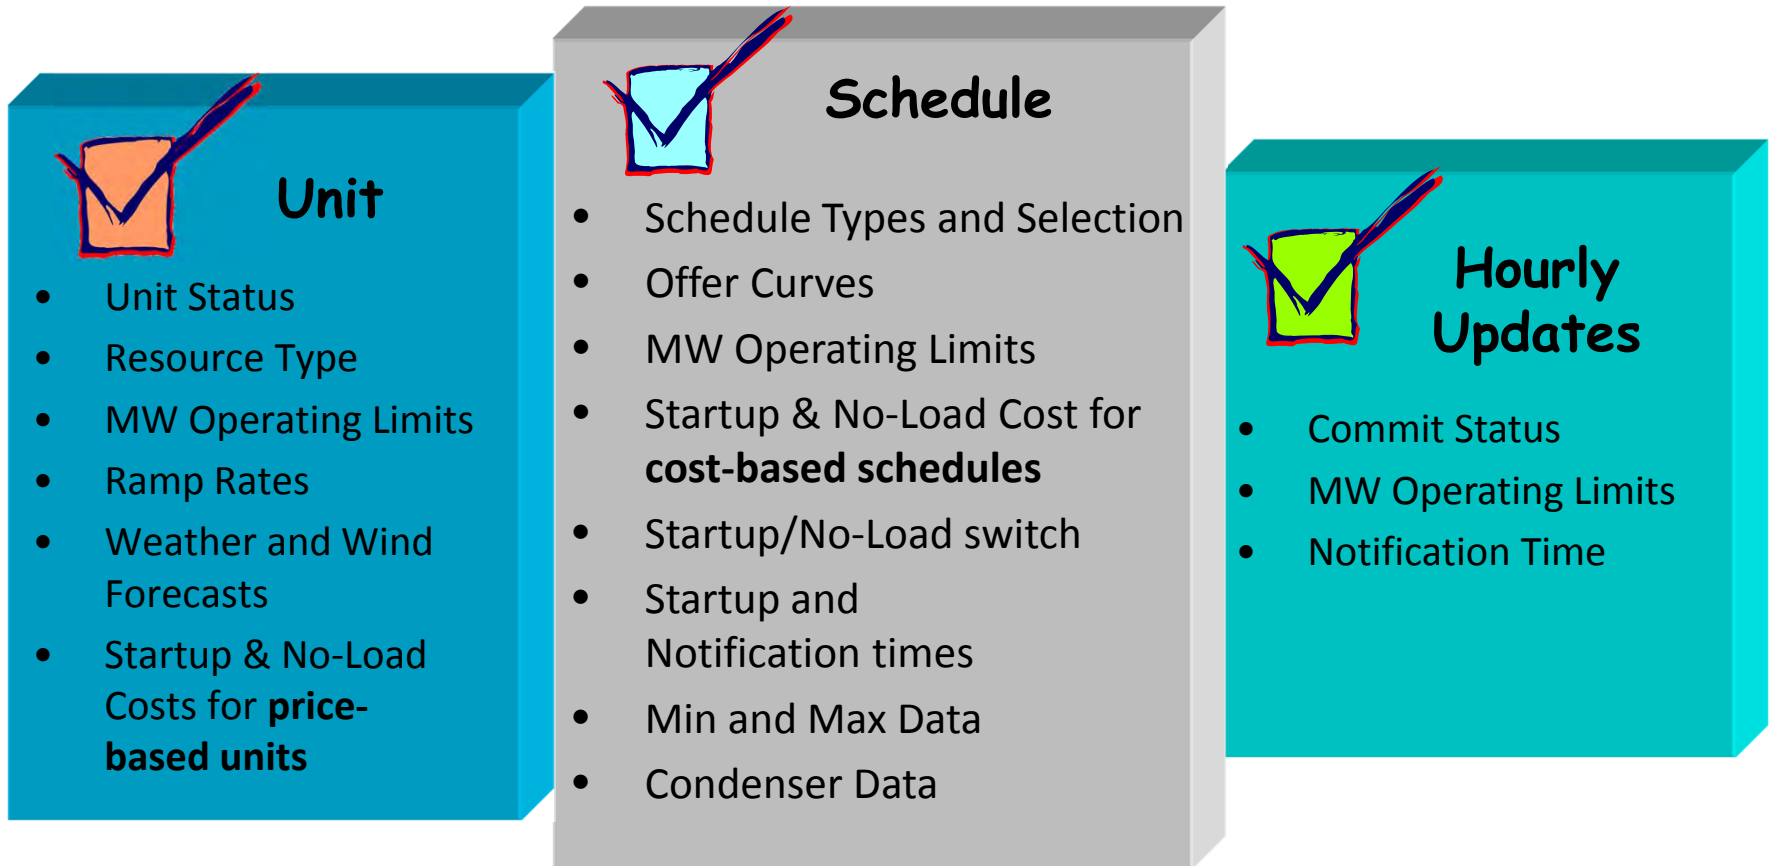

The operating limits are defined on a **schedule basis and unit basis**. Operating limits defined on a schedule basis override the operating limits that are defined on a unit basis

- **Emergency Max (MW)** - The MW energy level at which the operating company operates the generating unit once PJM requests Maximum Emergency Generation. This represents the highest short-term MW level a generating unit can produce and may require extraordinary procedures to produce the desired output
- **Economic Max (MW)** - The highest unrestricted level of energy, in MW, that the operating company operates the unit. This represents the highest output available from the unit for economic dispatch

Operational Limits (cont.)

- **Economic Min (MW)** - The minimum energy available from the unit for economic dispatch
- **Emergency Min (MW)** - The lowest level of energy in MW the unit can produce and maintain a stable level of operation. The Operating Company operates the unit at this level during a Minimum Generation Emergency
- **CIR** - Indicates the MW value of the Capacity Interconnection Rights of the wind resource
 - For a wind resource, the Economic Min and Emergency Min must be less than or equal to the resource's CIR value

Unit Parameters in eMKT

01												

Commit Status

- Economic - Unit is available and offered into the market for PJM to schedule
- Must Run - Indicates that the generating unit is self-scheduling. Unit MUST be committed. The unit is committed at Economic Min and allowed to move up to Economic Max
 - **Note:** To fix output, make economic min and max the same value
- Emergency - Entire unit is placed in “Max Emergency” category and will not be scheduled unless PJM calls for Max Emergency generation
- Unavailable - Unit is out of service and will not be scheduled
 - **Note:** Must have a corresponding outage ticket in eDART if a capacity resource

Energy Ramp Rates

Portfolio: Unit: Date: 12/27/2013

Energy Ramp Rates for on 12/27/2013

<input type="checkbox"/>	MW	Ramp Rate
<input type="checkbox"/>	77.0	1.0
<input type="checkbox"/>	120.0	1.0
<input type="checkbox"/>	140.0	
<input type="checkbox"/>	152.0	
<input type="checkbox"/>	177.0	
<input type="checkbox"/>	190.0	
<input type="checkbox"/>	205.0	
<input type="checkbox"/>	220.0	
<input type="checkbox"/>	260.0	
<input type="checkbox"/>	290.0	

The MW segment ramp rates are used during real-time operations

A maximum of 10 Ramp Rate segments can be defined

- The first MW/ramp rate segment represents the ramp rate from 0 MW/0 Min to the first MW/Min point
- The second MW/ramp rate point represents the ramp rate from the first MW point to the second MW point (and so on)

Schedule Parameters

Unit Schedule Requirements

- Units must have at least one Cost-Based Schedule and a Price-Based Schedule available
1. Cost-based Schedule must be Parameter Limited
 2. Two Price-based schedules, one of which must be Available
 - a) Non Parameter Limited
 - b) Parameter Limited (if unavailable, then “Use Max Gen” on Schedule Selection page must be set to yes)

The Operating Company marks schedules available for the day-ahead market and the balancing market using the Schedule Detail web page. This can be done when the schedule detail information is initially determined. The following information is used:

- **DayAhead** - Indicates whether the schedule is available for the day-ahead market
- **Balancing** - Indicates whether or not the schedule is available for the balancing market (used for re-bidding period)
- **Both** - Indicates whether or not the schedule is available for both the day-ahead market and balancing market (used for re-bidding period)

Minimum Runtime(Hour) Limit: 24.00			
Opportunity Cost Component (\$/MWh)			

- Minimum Downtime (hour) — The minimum number of hours between when the unit shuts-down and the next time the unit is put online
- Minimum Runtime (hour) — The minimum number of hours a unit must run
- Maximum Weekly Starts — The maximum number of times a unit can be started in one week
- Maximum Runtime (hour) — The max number of hours a unit can run before it needs to be shut down
- Maximum Daily Starts — The maximum number of times that a unit can be started in a day
- Maximum Weekly Energy (MWh) — The maximum amount of energy, reported in MWh, that the unit can produce in one week used for study purposes
