

# Generation Interconnection Feasibility Study Report for

Queue Project AE1-209

MODOC – DESOTO 138 KV

13 MW Capacity / 100 MW Energy

#### **Preface**

The intent of the feasibility study is to determine a plan, with ballpark cost and construction time estimates, to connect the subject generation to the PJM network at a location specified by the Interconnection Customer. The Interconnection Customer may request the interconnection of generation as a capacity resource or as an energy-only resource. As a requirement for interconnection, the Interconnection Customer may be responsible for the cost of constructing: (1) Direct Connections, which are new facilities and/or facilities upgrades needed to connect the generator to the PJM network, and (2) Network Upgrades, which are facility additions, or upgrades to existing facilities, that are needed to maintain the reliability of the PJM system.

In some instances, a generator interconnection may not be responsible for 100% of the identified network upgrade cost because other transmission network uses, e.g. another generation interconnection, may also contribute to the need for the same network reinforcement. Cost allocation rules for network upgrades can be found in PJM Manual 14A, Attachment B. The possibility of sharing the reinforcement costs with other projects may be identified in the feasibility study, but the actual allocation will be deferred until the impact study is performed.

The Interconnection Customer seeking to interconnect a wind generation facility shall maintain meteorological data facilities as well as provide that meteorological data which is required per Schedule H to the Interconnection Service Agreement and Section 8 of Manual 14D.

An Interconnection Customer with a proposed new Customer Facility that has a Maximum Facility Output equal to or greater than 100 MW shall install and maintain, at its expense, phasor measurement units (PMUs). See Section 8.5.3 of Appendix 2 to the Interconnection Service Agreement as well as section 4.3 of PJM Manual 14D for additional information.

PJM utilizes manufacturer models to ensure the performance of turbines is properly captured during the simulations performed for stability verification and, where applicable, for compliance with low voltage ride through requirements. Turbine manufacturers provide such models to their customers. The list of manufacturer models PJM has already validated is contained in Attachment B of Manual 14G. Manufacturer models may be updated from time to time, for various reasons such as to reflect changes to the control systems or to more accurately represent the capabilities turbines and controls which are currently available in the field. Additionally, as new turbine models are developed, turbine manufacturers provide such new models which must be used in the conduct of these studies. PJM needs adequate time to evaluate the new models in order to reduce delays to the System Impact Study process timeline for the Interconnection Customer as well as other Interconnection Customers in the study group. Therefore, PJM will require that any Interconnection Customer with a new manufacturer model must supply that model to PJM, along with a \$10,000 fully refundable deposit, no later than three (3) months prior to the starting date of the System Impact Study (See Section 4.3 for starting dates) for the Interconnection Request which shall specify the use of the new model.

The Interconnection Customer will be required to submit a completed dynamic model study request form (Attachment B-1 of Manual 14G) in order to document the request for the study.

The Feasibility Study estimates do not include the feasibility, cost, or time required to obtain property rights and permits for construction of the required facilities. The project developer is responsible for the right of way, real estate, and construction permit issues. For properties currently owned by Transmission Owners, the costs may be included in the study.

#### General

The Interconnection Customer has proposed a Wind generating facility located in Randolph County, Indiana. The installed facilities will have a total capability of 100 MW with 13 MW of this output being recognized by PJM as Capacity. The proposed in-service date for this project is October 2021. This study does not imply a TO commitment to this in-service date.

The Feasibility Study includes Short Circuit and Peak Load steady state power flow analyses. The conduct of power flow studies at other load levels, stability analysis, and coordination with non-PJM Transmission Planners, as required under the PJM planning process, is not performed during the Generation Interconnection Feasibility Study phase of the PJM study process. Additional reinforcement requirements for this Interconnection Request may be defined during the conduct of these additional analyses which shall be performed following execution of the System Impact Study agreement.

The objective of this Feasibility Study is to determine budgetary cost estimates and approximate construction timelines for identified transmission facilities required to connect the proposed generating facilities to the AEP transmission system. These reinforcements include the Attachment Facilities, Local Upgrades, and Network Upgrades required maintaining the reliability of the AEP transmission system. Stability analysis is not included as part of this study.

#### **Primary Point of Interconnection**

AE1-209 will interconnect with the AEP transmission system via a proposed switching station cut into the Modoc – Desoto 138 kV section of the College Corner – Desoto 138kV Circuit being constructed for PJM project #AD1-128.

To accommodate the interconnection in the Modoc – Desoto 138kV line section, install one (1) new 138kV circuit breaker at the proposed switching station (See figure #2) physically configured in a breaker and half arrangement but operated as ring bus being constructed for AD1-128 (See Figure 1). Installation of associated protection and control equipment, 138 kV line risers, SCADA, and 138 kV revenue metering will also be required. AEP reserves the right to specify the final acceptable configuration considering design practices, future expansion, and compliance requirements.

#### Notes:

PJM Supplemental Project s1610 contains plans to retire the Delaware 138kV station exits toward College Corner and Selma Parker, and re-terminate them into the Desoto 138kV Station. The projected in service date is 06/2019.

#### **Cost Summary**

The AE1-209 project will be responsible for the following costs:

| Description                            | Total Cost   |
|--|--------------|
| Attachment Facilities                  | \$ 1,750,000 |
| Direct Connection Network Upgrade      | \$ 250,000   |
| Non Direct Connection Network Upgrades | \$ 500,000   |
| Total Costs                            | \$ 2,500,000 |

In addition, the AE1-209 project may be responsible for a contribution to the following costs

| Description     | Total Cost |
|-----------------|------------|
| System Upgrades | \$ 155,000 |

Cost allocations for these upgrades will be provided in the System Impact Study Report.

# **Transmission Owner Scope of Work**

# **Attachment Facilities**

The total preliminary cost estimate for the Attachment work is given in the table below. These costs do not include CIAC Tax Gross-up.

| Description  | Total Cost   |
|--|--------------|
| <ul> <li>Install new 138kV circuit breaker at the proposed AD1-<br/>128 switching station. Installation of associated<br/>protection and control equipment, 138 kV line risers<br/>and SCADA will also be required.</li> </ul> | \$1,750,000  |
| Total Attachment Facility Costs  | \$ 1,750,000 |

## **Direct Connection Cost Estimate**

The total preliminary cost estimate for the Direct Connection work is given in the table below. These costs do not include CIAC Tax Gross-up.

| Description                                   | Total Cost |
|---|------------|
| 138kV Revenue Metering                        | \$ 250,000 |
| <b>Total Direct Connection Facility Costs</b> | \$250,000  |

# **Non-Direct Connection Cost Estimate**

The total preliminary cost estimate for the Non-Direct Connection work is given in the table below. These costs do not include CIAC Tax Gross-up.

| Description  | Total Cost |
|--|------------|
| Upgrade line protections & Controls at the Desoto 138kV Substation       | \$ 250,000 |
| Upgrade line protections & Controls at the Selma Parker 138kV Substation | \$ 250,000 |
| Total Non-Direct Connection Facility Costs                               | \$ 500,000 |

# **Incremental Capacity Transfer Rights (ICTRs)**

Will be determined at a later study phase

## **Schedule**

It is anticipated that the time between receipt of executed Agreements and Commercial Operation may range from 12 to 18 months if no line work is required. If line work is required, construction time would generally be between 24 to 36 months after Agreement execution.

# **Transmission Owner Analysis**

Note: PJM Supplemental Project s1610 contains plans to retire the Delaware 138kV station exits toward College Corner and Selma Parker, and re-terminate them into the Desoto 138kV Station. The projected in service date is 06/2019. The effects of this configuration change should be considered prior to the start of the System Impact Study for AE1-209.

## **Interconnection Customer Requirements**

It is understood that the Interconnection Customer is responsible for all costs associated with this interconnection. The costs above are reimbursable to AEP. The cost of the Interconnection Customer's generating plant and the costs for the line connecting the generating plant at the Modoc – Desoto138 kV section of College Corner – Desoto 138kV circuit are not included in this report; these are assumed to be the Interconnection Customer's responsibility.

The Generation Interconnection Agreement does not in or by itself establish a requirement for American Electric Power to provide power for consumption at the developer's facilities. A separate agreement may be reached with the local utility that provides service in the area to ensure that infrastructure is in place to meet this demand and proper metering equipment is installed. It is the responsibility of the developer to contact the local service provider to determine if a local service agreement is required.

Requirement from the PJM Open Access Transmission Tariff:

An Interconnection Customer entering the New Services Queue on or after October 1, 2012 with a
proposed new Customer Facility that has a Maximum Facility Output equal to or greater than 100 MW
shall install and maintain, at its expense, phasor measurement units (PMUs). See Section 8.5.3 of
Appendix 2 to the Interconnection Service Agreement as well as section 4.3 of PJM Manual 14D for
additional information.

The Interconnection Customer may be required to install and/or pay for metering as necessary to properly track real time output of the facility as well as installing metering which shall be used for billing purposes. See Section 8 of Appendix 2 to the Interconnection Service Agreement as well as Section 4 of PJM Manual 14D for additional information.

## **Revenue Metering and SCADA Requirements**

#### **PJM Requirements**

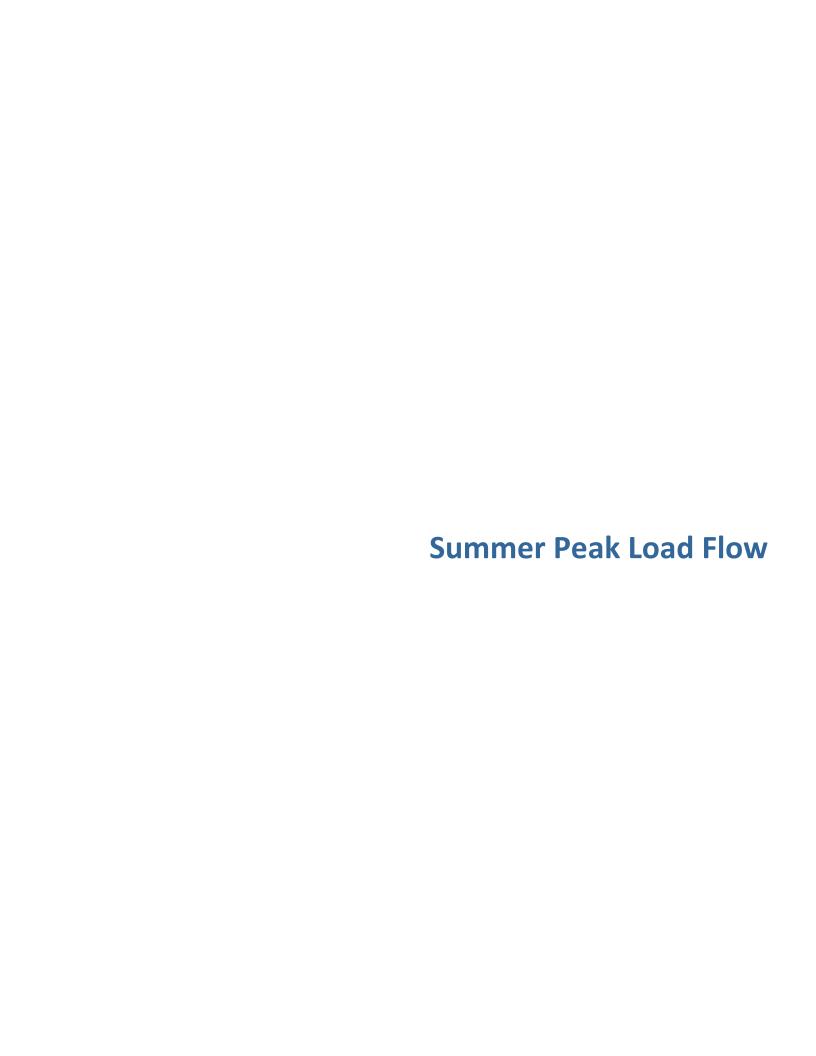

The Interconnection Customer will be required to install equipment necessary to provide Revenue Metering (KWH, KVARH) and real time data (KW, KVAR) for IC's generating Resource. See PJM Manuals M-01 and M-14D, and PJM Tariff Section 8 of Attachment O.

The Interconnection Customer will be required to comply with all AEP Revenue Metering Requirements for Generation Interconnection Customers. The Revenue Metering Requirements may be found within the "Requirements for Connection of New Facilities or Changes to Existing Facilities Connected to the AEP Transmission System" document located at the following link:

http://www.pjm.com/~/media/planning/plan-standards/private-aep/aep-interconnection-requirements.ashx

# **Option -1 Network Impacts**

The Queue Project AE1-209 was evaluated as a 100 MW (Capacity 13 MW) injection via AD1-128 proposed switching station cut into Modoc – Desoto 138 kV section of College Corner – Desoto 138kV circuit AEP area. Project AE1-209 was evaluated for compliance with applicable reliability planning criteria (PJM, NERC, NERC Regional Reliability Councils, and Transmission Owners). Project AE1-209 was studied with a commercial probability of 53%. Potential network impacts were as follows:

# **Generation Deliverability**

(Single or N-1 contingencies for the Capacity portion only of the interconnection)

None

# **Multiple Facility Contingency**

(Double Circuit Tower Line, Fault with a Stuck Breaker, and Bus Fault contingencies for the full energy output)

None

# **Contribution to Previously Identified Overloads**

(This project contributes to the following contingency overloads, i.e. "Network Impacts", identified for earlier generation or transmission interconnection projects in the PJM Queue)

## **Potential Congestion due to Local Energy Deliverability**

PJM also studied the delivery of the energy portion of this interconnection request. Any problems identified below are likely to result in operational restrictions to the project under study. The developer can proceed with network upgrades to eliminate the operational restriction at their discretion by submitting a Merchant Transmission Interconnection request.

Note: Only the most severely overloaded conditions are listed below. There is no guarantee of full delivery of energy for this project by fixing only the conditions listed in this section. With a Transmission Interconnection Request, a subsequent analysis will be performed which shall study all overload conditions associated with the overloaded element(s) identified.

# **System Reinforcements**

| ID                              | Index | Facility  | Upgrade Description  | Cost      |
|---------------------------------|-------|---|--|-----------|
| 851737,853106,2429<br>82,241831 | 1     | 05COLLCO 138.0 kV -<br>08COLINV 138.0 kV Ckt 1  | AEP Description:  1) A Sag Study will be required on the 0.15 mile section of line to mitigate the overload. New Rating after the Sag Study: S/N: 167 MVA S/E: 178 MVA. Depending on the sag study results, cost for this upgrade is expected to be between \$20,000 (no remediations required just sag study) and \$0.3 million (complete line reconductor/rebuild required).  Time Estimate: a) Sag Study: 6-12 months b) Rebuild: The standard time required for construction differs from state to state. An approximate construction time would be 24 to 36 months after signing an interconnection agreement.  Time Estimate: 6-12 Months Cost: \$20,000  Note: The final loading is 200.5MVA. Duke to provide mitigations for their portion of the circuit during the Impact Study Phase. | \$20,000  |
| 243087                          | 2     | OVEC A Sag Study will be required on the 33.5 miles of 14: ACSR/PE Conductor, to mitigate the overload. The n after sag study and any required mitigation will be: \$ MVA, S/E: 1419 MVA. The estimated study cost is \$1 The cost of any mitigation will depend on the outcoi sag study. |  | \$135,000 |
|                                 |       |   | TOTAL COST   | \$155,000 |

#### **Flow Gate Details**

The following appendices contain additional information about each flowgate presented in the body of the report. For each appendix, a description of the flowgate and its contingency was included for convenience. However, the intent of the appendix section is to provide more information on which projects/generators have contributions to the flowgate in question. Although this information is not used "as is" for cost allocation purposes, it can be used to gage other generators impact. It should be noted the generator contributions presented in the appendices sections are full contributions, whereas in the body of the report, those contributions take into consideration the commercial probability of each project.

Affected Systems

#### LG&E

LG&E Impacts to be determined during later study phases (as applicable).

#### **MISO**

MISO Impacts to be determined during later study phases (as applicable).

#### **TVA**

TVA Impacts to be determined during later study phases (as applicable).

# **Duke Energy Progress**

Duke Energy Progress Impacts to be determined during later study phases (as applicable).

#### **NYISO**

NYISO Impacts to be determined during later study phases (as applicable).

| Short | Circuit |
|-------|---------|
|       |         |

# **Short Circuit**

The following Breakers are overduty

None

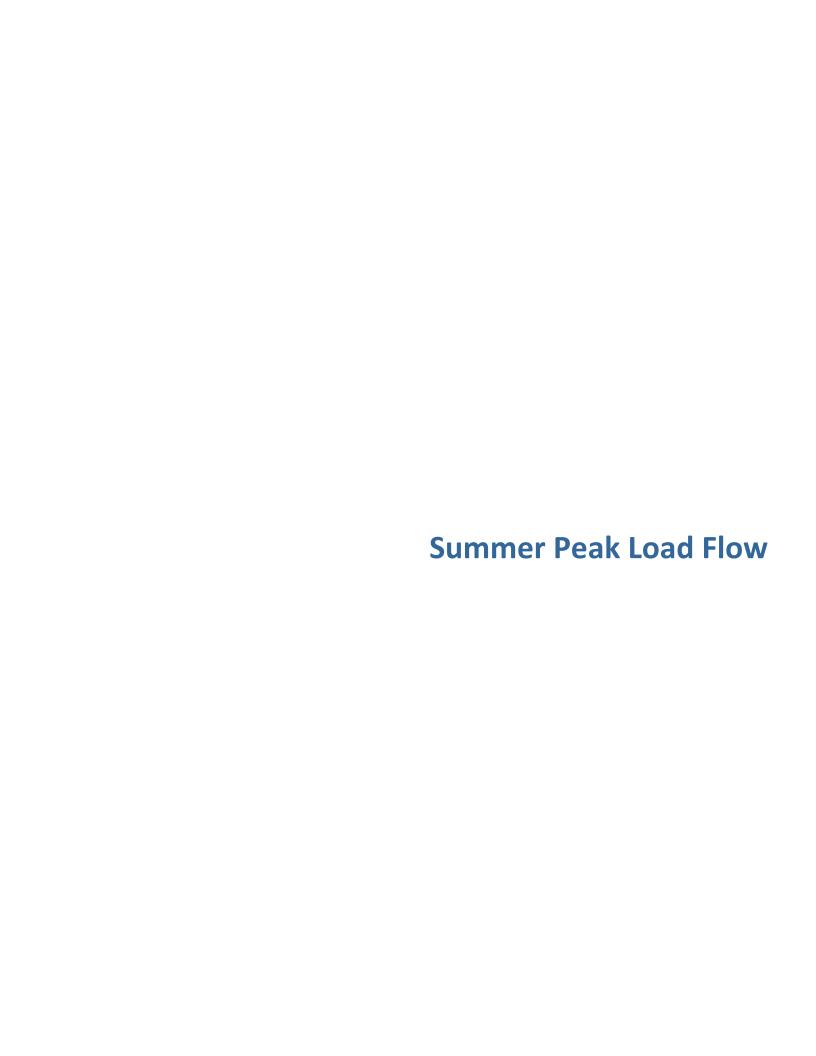

## **Secondary Point of Interconnection:**

The secondary point of Interconnection is at AEP's Desoto 345kV station.

To accommodate the Interconnection at Desoto 345kV, install one new 345 circuit breaker at Desoto 345kV station. Installation of associated protection and control equipment, 138 kV line risers, SCADA, and 138 kV revenue metering will also be required. AEP reserves the right to specify the final acceptable configuration considering design practices, future expansion, and compliance requirements.

## **Option-2: Network Impacts**

The Queue Project AE1-209 was evaluated as a 100 MW (Capacity 13 MW) injection at the Desoto 345 kV substation in the AEP area. Project AE1-209 was evaluated for compliance with applicable reliability planning criteria (PJM, NERC, NERC Regional Reliability Councils, and Transmission Owners). Project AE1-209 was studied with a commercial probability of 53%. Potential network impacts were as follows:

## **Generation Deliverability**

(Single or N-1 contingencies for the Capacity portion only of the interconnection)

None

## **Multiple Facility Contingency**

(Double Circuit Tower Line, Fault with a Stuck Breaker, and Bus Fault contingencies for the full energy output)

<sup>\*829128:</sup> Desoto – Jay 138kV SE rating is 392 MVA. PJM Baseline project B3103 will raise the SE rating from 392 MVA to 409MVA. The projected ISD for B3103 is 12/10/21.

## **Contribution to Previously Identified Overloads**

(This project contributes to the following contingency overloads, i.e. "Network Impacts", identified for earlier generation or transmission interconnection projects in the PJM Queue)

<sup>\*829127:</sup> Desoto – Jay 138kV SE rating is 392 MVA. PJM Baseline project B3103 will raise the SE rating from 392 MVA to 409MVA. The projected ISD for B3103 is 12/10/21.

# Potential Congestion due to Local Energy Deliverability

PJM also studied the delivery of the energy portion of this interconnection request. Any problems identified below are likely to result in operational restrictions to the project under study. The developer can proceed with network upgrades to eliminate the operational restriction at their discretion by submitting a Merchant Transmission Interconnection request.

Note: Only the most severely overloaded conditions are listed below. There is no guarantee of full delivery of energy for this project by fixing only the conditions listed in this section. With a Transmission Interconnection

| Request, a subsequent analysis will be performed which shall study all overload conditions associated with | the |
|--|-----|
| overloaded element(s) identified.  |     |

None

#### Flow Gate Details

The following appendices contain additional information about each flowgate presented in the body of the report. For each appendix, a description of the flowgate and its contingency was included for convenience. However, the intent of the appendix section is to provide more information on which projects/generators have contributions to the flowgate in question. Although this information is not used "as is" for cost allocation purposes, it can be used to gage other generators impact. It should be noted the generator contributions presented in the appendices sections are full contributions, whereas in the body of the report, those contributions take into consideration the commercial probability of each project.
